

This is an Open Access document downloaded from ORCA, Cardiff University's institutional repository:<https://orca.cardiff.ac.uk/id/eprint/101264/>

This is the author's version of a work that was submitted to / accepted for publication.

Citation for final published version:

Pritchard, Manon F. , Powell, Lydia C. , Jack, Alison A., Powell, Kate , Beck, Konrad , Florance, Hannah, Forton, Julian, Rye, Philip D., Dessen, Arne, Hill, Katja E. and Thomas, David W. 2017. A low-molecular-weight alginate oligosaccharide disrupts pseudomonas microcolony formation and enhances antibiotic effectiveness. *Antimicrobial Agents and Chemotherapy* 61 (9) , e00762-17. 10.1128/AAC.00762-17

3

4 **FIG S1** Circular dichroism (CD) spectra of high Mw pseudomonal alginate mixed with OligoG CF-5/20. Scans 1-7 show spectra of high Mw
5 alginate (~20 μM) followed over ~77 min upon heating from 4 to 37 $^{\circ}\text{C}$; scans 8-11 (~44min) are recorded after addition of OligoG CF-5/20 (850
6 μM) followed by addition of Ca^{2+} (1mM) (scans 12-17, ~ 66min). Spectra of OligoG CF-5/20 (850 μM) alone and its sum with high Mw alginate
7 (20 μM) are shown as black and red dashed lines, respectively.

10

11 **FIG S2** CD spectra of high Mw pseudomonal alginate mixed with OligoG CF-5/20. Scans 1-2 show spectra of high Mw alginate ($\sim 20 \mu\text{M}$)
 12 followed over ~ 20 min after heating from 4 to 37°C , after which Ca^{2+} was added to a final concentration of 1mM (scans 3-8) and 2 mM (scans
 13 9-11). Oligo G CF-5/20 was added to $c_{\text{fin}} = 700\mu\text{M}$ (scans 12-15; molar ratio high Mw alginate to OligoG CF-5/20 1:50) and $c_{\text{fin}} = 4.2\text{mM}$ (scans
 14 16-22; molar ratio high Mw alginate to OligoG CF-5/20 1:600. Adding calcium to $c_{\text{fin}} = 9 \text{mM}$ results in spontaneous alginate precipitation (scans
 15 23-25).
