Lung transplant recipients' experiences of and attitudes towards self-management: a qualitative systematic review protocol.

3

4 Background

Lung transplantation (LuT) is an established treatment to improve the survival of patients with 5 end-stage lung diseases and has been performed in over 40,000 patients worldwide.^{1,2} Lung 6 7 transplantation is performed in patients suffering from a variety of lung diseases such as chronic obstructive pulmonary disease, bronchiectasis, cancer, connective tissue disease, 8 idiopathic interstitial pneumonia, interstitial lung disease, pulmonary arterial hypertension, 9 lymphangioleiomyomatosis, obliterative bronchiolitis, sarcoidosis, other lung diseases or 10 retransplant.³ Eligible for transplant are patients with one of the above end-stage lung 11 diseases who meet all of the following criteria: (1) High (>50%) risk of death from lung 12 disease within 2 years if LuT is not performed, (2) high (>80%) likelihood of surviving at least 13 90 days after LuT and (3) high (>80%) likelihood of 5-year post-transplant survival from a 14 general medical perspective provided that there is adequate graft function.⁴ There are 15 various absolute and relative contraindications including but not limited to untreatable 16 17 dysfunction of another major organ system or non-adherence to medical therapy. A recent review indicates that LuT substantially improves quality of life, especially in the domains of 18 physical health and functioning.⁵ Over recent years, survival time after receiving a lung 19 transplant has improved significantly, with 79% of all lung transplant recipients surviving the 20 21 first year after transplantation. The median survival of patients is now about eight years following LuT.³ 22 Despite the undoubted benefits of LuT, it is not a 'cure' for end-stage lung diseases.⁶ Similar 23

to other solid organ transplant recipients, the focus of care for lung transplant recipients has

- 25 shifted from the direct postoperative phase to one of long-term follow-up.⁷ Lung transplant
- recipients are increasingly regarded as chronically ill patients⁶ who need to adapt to and
- follow complex self-management tasks⁸ to prevent complications, such as graft rejection or
- infections, and to enable the patient to keep the transplanted graft as long as possible.⁹

This paradigmatic shift from short to long-term care of lung transplant recipients has resulted in the application of chronic illness management strategies that aim to foster lung transplant

- 31 recipients' self-management.¹⁰ Self-management, in this regard, can be defined as an:
- 32 "individual's ability to manage the symptoms, treatment, physical and
 33 psychological consequences and life style changes inherent in living with a
 34 chronic condition".^{11(p178)}

To understand self-management after LuT, a conceptual model originally developed in the 35 context of renal transplantation may be useful.¹² This model reports that self-management 36 after transplantation comprises of adherence to a life-long medical regimen including 37 medication-taking,^{8,10} self-monitoring of lung function and signs and symptoms of 38 complications,^{10,13} and maintaining a healthy lifestyle.¹⁰ The latter requires lung transplant 39 recipients to adapt to various behaviors, which may include fundamental lifestyle changes for 40 41 individual patients, such as abstaining from harmful substances, keeping medical appointments, refraining from smoking, eating healthily, exercising, and protecting from the 42 sun.^{10,12,14} In order to follow these behaviors, lung transplant recipients need to possess and 43 44 execute a set of skills including action-taking, decision making, problem solving, resource 45 finding and utilization as well as the establishment of partnerships with healthcare providers.¹⁵ 46

47 Research has indicated that lung transplant recipients realize the importance of following

48 multi-dimensional self-management behaviors.^{16,17} However, research has also shown that

- 49 self-management is insufficient in many aspects.^{9,10,18-21} Of these self-management aspects,
- 50 medication adherence has been studied most extensively with up to 72% of lung transplant
- 51 recipients displaying some extent of medication non-adherence at some time.^{10,22} Suboptimal
- 52 implementation of transplant-related self-management is also reported in other self-
- 53 management tasks including infrequent use of self-monitoring of lung function.^{16,19,20,23}
- 54 Likewise, smoking cessation proves difficult in some lung transplant recipients.^{24,25}
- 55 Consequently, there is a gap between patients' awareness of the need and importance of
- 56 self-management and individual health-related behavior.

Research in solid organ transplant recipients has shown that adherence to self-management 57 tasks depends on patients' personal experiences and attitudes rather than on non-modifiable 58 factors such as gender, age or ethnicity.²⁶⁻²⁸ Qualitative research in renal transplant 59 recipients, for example, has demonstrated that a major driver for medication adherence is 60 experience of dialysis treatment.²⁹⁻³¹ Likewise, lung transplant recipients with cystic fibrosis 61 with prior experience of home spirometry displayed better adherence to home spirometry 62 than other lung transplant patients.¹⁶ Attitudes also play an important role in the self-63 management of many conditions. In 2003, the World Health Organization³² identified 64 patients' attitudes as one of several patient-related factors which affected adherence to self-65 management in patients with HIV³³, epilepsy,³⁴ and diabetes.³⁵ In renal transplant recipients, 66 skepticism or medication-related concerns were shown to be associated with inadequate 67 medication adherence.^{36,37} A positive, optimistic attitude to life and illness in general was also 68 shown to be an important part of managing ones' everyday life after lung and heart 69

70 transplantation.^{38,39}

Experiences and attitudes, defined as a "tendency that is expressed by evaluating a 71 particular entity with some degree of favor or disfavor"^{13(p666)}, as well as values, beliefs or 72 knowledge can best be explored using qualitative research methods.⁴⁰⁻⁴² In the case of solid 73 organ transplant recipients, this has been performed to some extent, however, research has 74 primarily focused on isolated self-management tasks such as medication-taking²⁸, social 75 adaptation¹⁷, alcohol abstinence⁴³, smoking cessation⁴⁴ or physical activity⁴⁵, neglecting the 76 multidimensionality of self-management after solid organ transplantation.⁴⁶ Synthesizing 77 qualitative evidence by conducting systematic reviews may deepen our comprehension of 78 79 how patients perceive and execute self-management. A systematic review on renal transplant recipients' motivations, challenges and attitudes to self-management has been 80 performed recently.²⁷ However, no qualitative systematic review on any aspect of LuT or on 81 lung transplant recipients' experiences of and attitudes towards self-management could be 82 found in the Joanna Briggs Institute (JBI) Database of Systematic Reviews and 83 Implementation Reports, the Cochrane database of systematic reviews or the PROSPERO 84

- 85 international prospective register of systematic reviews.
- 86 The reasons for the gap between lung transplant recipients' awareness of the need for self-
- 87 management and their self-management behavior remain unclear. This review aims to
- 88 identify lung transplant recipients' experiences of and attitudes towards self-management.
- 89 The findings of this review will help healthcare practitioners to better understand the
- 90 challenges their patients face, potentially resulting in more patient-centered education and an
- 91 increase in lung transplant recipients' self-management abilities.

92 Keywords

93 lung transplantation; self-management; attitude; experience

94 **Review Question**

95 What are lung transplant recipients' experiences of and attitudes towards self-management?

96 Methods

97 Inclusion Criteria

98 Participants

- 99 This review will consider studies that include persons over 18 years who have received a
- 100 lung transplant. No restrictions on underlying diseases, gender, ethnicity or length of time
- since transplant will be imposed. Studies including participants with mixed types of solid
- 102 organ transplantations will be included where it is possible to accurately identify data on
- 103 aspects of lung transplant-related self-management separately. Data on self-management

- related to other conditions will be excluded. Only studies on participants who are able to
- 105 perform their self-management tasks independently will be included.

106 Phenomena of Interest

- 107 This review will consider studies on the experiences and attitudes of lung transplant
- 108 recipients towards self-management.

109 **Context**

- 110 This review will consider all available evidence on lung transplant recipients worldwide. If this
- 111 review reveals regional and/or cultural differences in lung transplant recipients' experiences
- and attitudes towards self-management, these will be explicated in the review.

113 Study Types

- 114 This review will consider studies that focus on qualitative data including, but not limited to,
- designs such as phenomenology, grounded theory, ethnography, action research, and
- 116 feminist research. Mixed-methods studies will be included only when qualitative data can be
- 117 extracted separately.
- 118 Studies published in English or German will be considered for inclusion in this review,
- 119 however studies found in any other languages will be mentioned in the review. No date
- 120 restrictions will be imposed for inclusion in this review.

121 Search Strategy

- 122 The search strategy will aim to find both published and unpublished studies. An initial limited
- 123 search of MEDLINE and CINAHL has been undertaken using the terms "lung
- 124 transplantation", AND "self-management", AND ("attitude" OR "experience"). This was
- 125 followed by analysis of the text words contained in the title and abstract, and of the index
- terms used to describe the article. This informed the development of a search strategy which
- 127 will be tailored for each information source. A full search strategy for MEDLINE is detailed in
- 128 Appendix 1. The reference list of all studies selected for critical appraisal will be screened for
- 129 additional studies.
- 130 The databases to be searched from their inception will include:
- 131 MEDLINE, CINAHL, PsycINFO, EMBASE, Web of Science, British Nursing Index
- 132 The search for unpublished studies will include:
- 133 Proquest Dissertation & Theses Database, EThOS, Open Grey (Sigle)

134 Study Selection

- 135 Following the search, all identified citations will be collated and uploaded into Endnote and
- 136 duplicates removed. Titles and abstracts will then be screened by two independent reviewers

- for assessment against the inclusion criteria for the review. Studies that may meet the 137
- inclusion criteria will be retrieved in full and their details imported into JBI SUMARI. The full 138
- text of selected studies will be retrieved and assessed in detail against the inclusion criteria. 139
- 140 Full text studies that do not meet the inclusion criteria will be excluded and reasons for
- 141 exclusion will be provided in an appendix in the final systematic review report. Included
- studies will undergo a process of critical appraisal. The results of the search will be reported 142
- in full in the final report and presented in a PRISMA flow diagram.⁴⁷ Any disagreements that 143
- arise between the reviewers will be resolved through discussion, or with a third reviewer. 144

145 **Critical Appraisal**

- 146 Selected studies will be critically appraised by two independent reviewers for methodological
- guality in the review using the JBI Qualitative Assessment and Review Instrument.⁴⁸ Any 147
- 148 disagreements that arise between the reviewers will be resolved through discussion, or with
- 149 a third reviewer. The results of critical appraisal will be reported in narrative form and in a
- table. 150
- All studies, regardless of the results of their methodological quality, will undergo data 151
- extraction and synthesis. Studies rated as "unclear" or "no" in seven or more QARI items will 152 153 be specified.

154 Data Extraction

- Qualitative data will be extracted from papers included in the review using the standardized 155
- data extraction tool⁴⁹ from JBI SUMARI by two reviewers. The data extracted will include 156
- specific details about the populations, context, culture, geographical location, study methods 157
- and the phenomena of interest relevant to the review question and specific objectives. 158
- 159 Findings, and their illustrations, will be extracted and assigned a level of credibility. Authors
- of primary studies will be contacted for clarification or missing information when necessary. 160

Data Synthesis 161

- Qualitative research findings will, where possible be pooled using JBI SUMARI with the 162 meta-aggregation approach.⁴⁸ This will involve the aggregation or synthesis of findings to
- 163
- generate a set of statements that represent that aggregation, through assembling the 164
- 165 findings and categorizing these findings on the basis of similarity in meaning. These
- categories are then subjected to a synthesis in order to produce a single comprehensive set 166
- 167 of synthesized findings that can be used as a basis for evidence-based practice. Where
- 168 textual pooling is not possible the findings will be presented in narrative form.

Assessing Confidence 169

- 170 The final synthesized findings will be graded according to the ConQual approach for
- establishing confidence in the output of qualitative research synthesis and presented in a 171

- 172 Summary of Findings table.⁵⁰ The Summary of Findings table includes the major elements of
- the review and details how the ConQual score is developed. Included in the table is the title,
- population, phenomena of interest and context for the specific review. Each synthesized
- 175 finding from the review is then presented along with the type of research informing it, a score
- 176 for dependability, credibility, and the overall ConQual score.

177 Conflicts of Interest

- 178 No conflict of interest.
- 179 Acknowledgements
- 180 None
- 181
