1. Methods

NMR Spectroscopy

Samples (10 mg) were dissolved in 99.9 atom % D₂O (600 µL) and analysed by NMR at 25 °C on a Bruker AVIII-HD 800 spectrometer equipped with CP-TCI 5 mm cryoprobe (Bruker BioSpin AG; Fällanden, Switzerland). Diffusion-ordered spectroscopy (DOSY) was used to measure the diffusion of the OligoG conjugate products. A 2D DOSY was measured using a Bruker BioSpin stimulated echo pulse sequence with bipolar gradients (STEBPGP). Gradient pulses of 2 ms duration (δ) and 32 different strengths varying linearly from 0.03 to 0.57 Tm⁻¹ were applied and the diffusion delay (Δ) was set to 80 ms. The spectra were recorded using the TopSpin software (version 3.5pl7) and analysed with the TopSpin software (version 4.0.7) (Bruker BioSpin AG; Fällanden, Switzerland).

2. Results

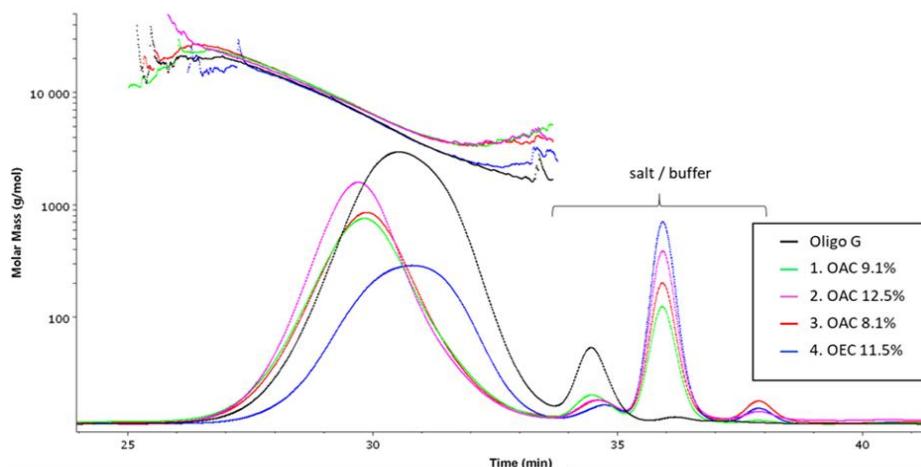

Figure S1. Size exclusion chromatography with multi-angle light scattering detection (SEC-MALS) analysis of OligoG-conjugates (three different batches of OligoG-A-colistin (OAC) and one batch of OligoG-E-colistin (OEC)), showing overlaid refractive index chromatograms and corresponding Mw-time calibration lines. The injected mass was 250 µg for all samples. Abbreviations: A, amide; E, ester.

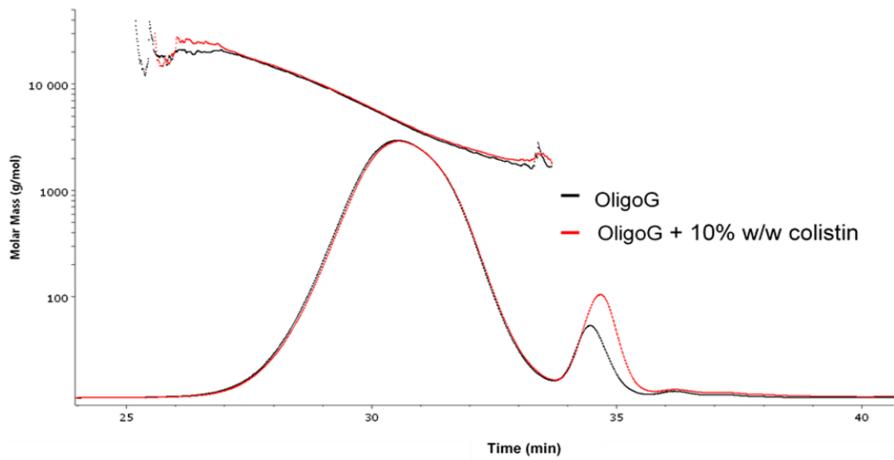

Figure S2. SEC-MALS analysis of OligoG in the absence and presence of 10% *w/w* colistin, showing that they do not form strong complexes since the elution profile is identical.

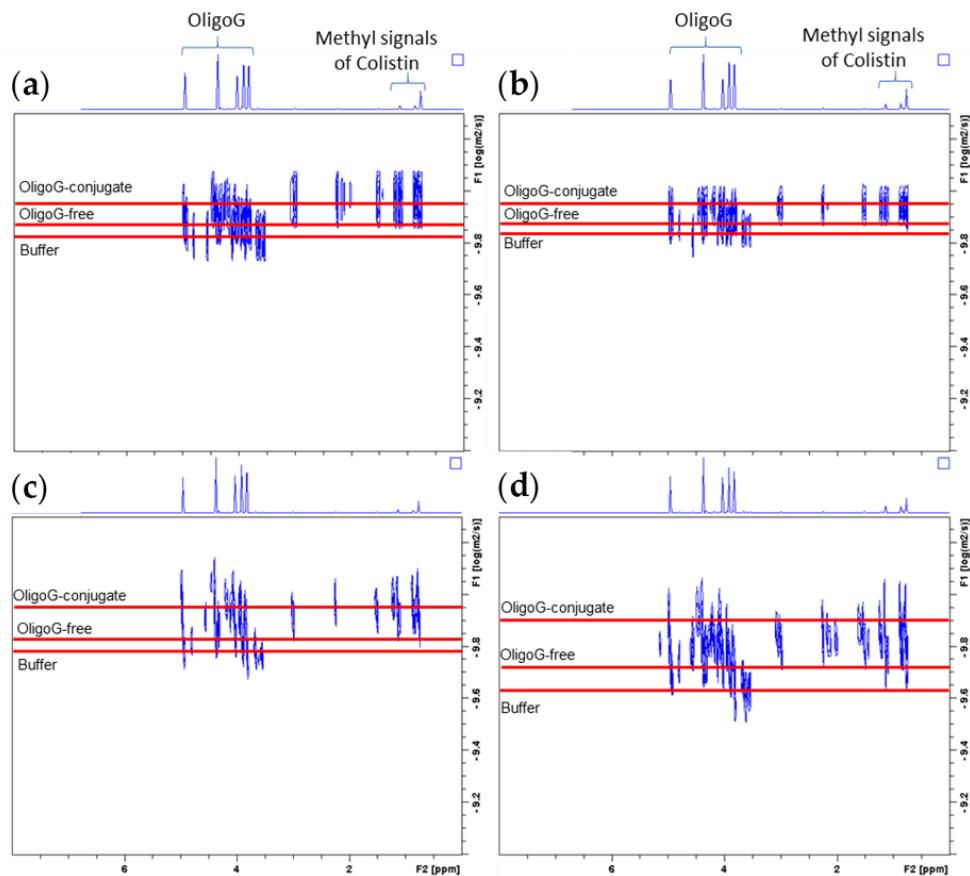

Figure S3. Diffusion-ordered spectroscopy (DOSY) of (a-c) three different batches of OligoG-A-colistin conjugates and (d) one batch of OligoG-E-colistin conjugate. The assignment of the unique signals for OligoG and colistin is indicated at the top of each panel and the red lines indicate the average diffusion coefficients of the molecules.

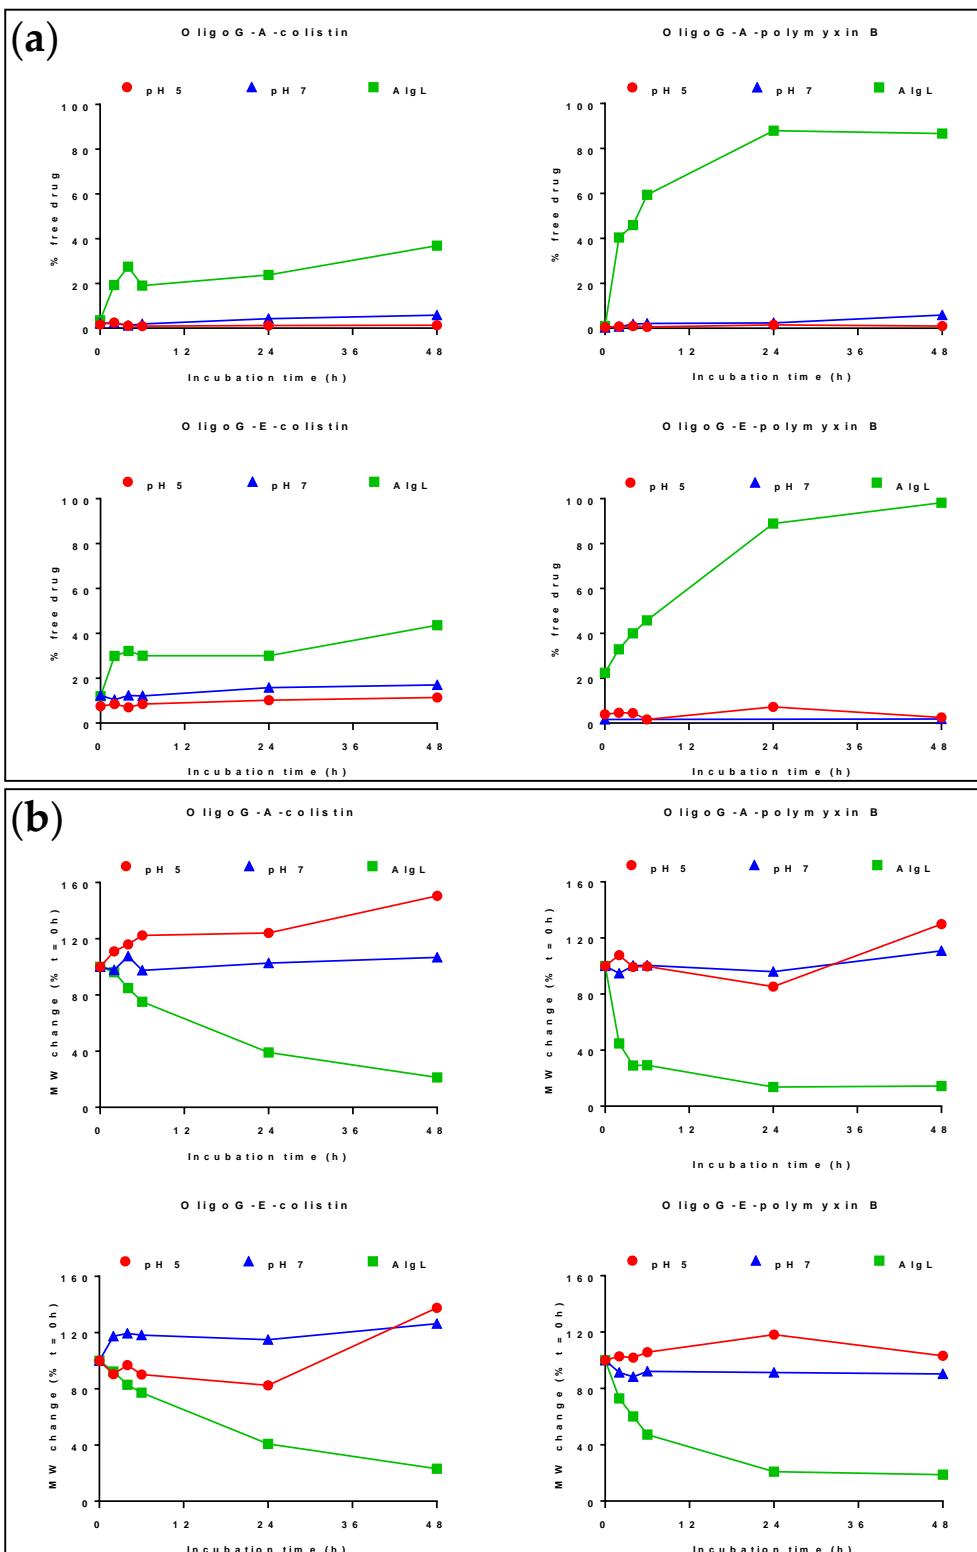

Figure S4. Drug release of OligoG-polymyxin conjugates in phosphate buffered saline (PBS) at pH 5, pH 7 or pH 7 containing alginate lyase (AlgL). **(a)** Content of free polymyxin and **(b)** change in molecular weight were determined by fast protein liquid chromatography (FPLC) and size exclusion chromatography with refractive index detection (SEC-RI), respectively, over 48 h incubation. Abbreviations: A, amide; E, ester.
