*Results are from independent univariate linear regression analyses testing the effect on total cerebellar volume of an interaction between tier-1 medical conditions and sex (male) (tier 1*sex), including all default covariates (age², sex, age²*sex, total brain volume, imaging centre attended, date attended) and tier 1 presence in the model. Of note, this was not performed for Pregnancy-related conditions*

*‡ Unique R² explained by the tier 1*sex interaction. Calculated: R² of model with interaction - R² of model without interaction*

**: p-value adjusted for False Discovery Rate (FDR) correction for the number of tests performed (FDR criterion used = 0.05)*

*Results are from independent univariate linear regression analyses testing the effect on total cerebellar volume of each tier 2 diagnosis, including all default covariates (age², sex, age²*sex, total brain volume, imaging centre attended, date attended)*

† Including those with the tier 2 condition and the “control” participants i.e. those without that tier 2 condition and without and tier 2 condition within the same tier 1 grouping

‡ Unique R² explained by the tier 2 diagnosis. Calculated: R² of model with tier 2 diagnosis - R² of model without tier 2 diagnosis

**: p-value adjusted for correction for the number of tests performed (FDR<0.05)*

Supplementary Table 2.12: The effect of each tier 2 ICD-10 recorded diagnoses on total cerebellar volume with additional head motion and body mass index correction

*Results are from independent univariate linear regression analyses testing the effect on total cerebellar volume of each tier 2 diagnosis, including all default covariates (age², sex, age²*sex, total brain volume, imaging centre attended, date attended), as well as both body mass index (BMI) and mean resting-state fMRI head displacement/motion*

† Including those with the tier 2 condition and the “control” participants i.e. those without that tier 2 condition and without and tier 2 condition within the same tier 1 grouping

‡ Unique R^2 explained by the tier 2 diagnosis. Calculated: R^2 of model with tier 2 diagnosis - R^2 of model without tier 2 diagnosis

**: p-value adjusted for correction for the number of tests performed (FDR<0.05)*
