Supplementary Figure 7. Heritability and co-heritability of different global-to-local parts in the face. Modular heritability (nodes, %) in sons and daughters, as obtained from the regression on fathers. Each node corresponds to the facial segments depicted in Figure 3. From each facial segment, connections are drawn to the two segments that have maximal correlation with the segment being tested, within the same hierarchical level. The red-blue spectrum represents levels of high and low heritability and co-heritability, respectively.
