51 Despite its many shortcomings, the Psoriasis Area and Severity Index (PASI)  
52 remains the standard method worldwide for psoriasis assessment<sup>1</sup>. Several studies  
53 have implemented electronic versions without evidence of formal validation, raising  
54 the possibility of lack of equivalence with the paper counterpart<sup>2</sup>. This study aimed at  
55 comparing the conventional paper-based and a novel electronic application version  
56 of the PASI (Figure 1). International Society for Pharmacoeconomics and Outcomes  
57 Research (ISPOR) guidelines<sup>3</sup> were followed to assess rater preference and  
58 consistency of scores.

59

60 The study employed a randomized cross-over design using a within-subjects  
61 comparison of the two formats of the PASI. The study was conducted at the  
62 dermatology outpatient department, University Hospital of Wales, Cardiff, UK.  
63 Inclusion criteria were: patients aged 18 years or older with a clinical diagnosis of  
64 chronic plaque psoriasis from a dermatologist and the ability to read and understand  
65 English. Raters ranged from medical students to senior trainees and received  
66 standardised clinical training for PASI assessment to ensure uniformity of rating. The  
67 study power was 80%, with an expected intra-class correlation coefficient (ICC) of  
68 0.9 ( $\alpha = 0.05$ ), resulting in a target sample size of 44 patients.

69

70 All three raters showed high correlation in test scores (Pearson-correlation 0.949,  
71  $p < 0.05$ ,  $n = 5$ ) demonstrating standardisation of the assessment criteria. Forty-four  
72 patients were recruited, mean age 45 years (SD  $\pm$  16, 59.1% male). The mean  
73 duration of chronic plaque psoriasis diagnosis was 19.2 years (SD  $\pm$  14.8,  
74 interquartile range, IQR, 8-30), with PASI severity ranging from 0.7 to 28.5. The ICC  
75 showed high concordance between the total PASI scores from paper and iPad

76 format (ICC = 0.993; 95% CI 0.988-0.996, Table 1). The median difference in PASI  
77 scores was also within the hypothesized difference of CC = 0.993 (p=0.72). The  
78 lower and higher limits of agreement were -1.4 and 1.4, respectively.

79 The PASI iPad® version demonstrated reduced inter-rater variability compared to  
80 the paper version (Pearson correlation 0.982 vs 0.949, number of patients  
81 assessed=5). There was no carryover effect demonstrated with scores (p=0.82) or  
82 time to completion (p=0.16) regardless of which format of the PASI was used first.  
83 The raters, using a stopwatch, took a median of 147 seconds (iPad®) versus 152  
84 seconds (paper), not including calculation time (p=0.81). Raters reported that the  
85 iPad version was easier to use compared to the paper version due to the visual  
86 nature of the application allowing accurate assessment and calculation of severity  
87 scores, though suggestions were made to improve the user interface.

88

89 The future of medical practice is intricately anchored within the evolution of digital  
90 technology. There is high correlation, and thus equivalence, between the PASI  
91 iPad® and paper versions. The raters preferred the iPad version due to the visual  
92 nature of the scoring process and the reduced likelihood of calculation errors. The  
93 higher inter-rater reliability and the inherent advantages of electronic tools<sup>4</sup> further  
94 re-enforces the superiority of the digital format. The validated Psoriasis 360  
95 application®, together with the previously validated DLQI<sup>5</sup> component, has the  
96 potential to be of considerable value to clinicians, researchers and patients.
