An analysis of the development of self-regulated learning skills in first year medical students: the impact of transition

Background

Self-Regulated Learning (SRL) is the ability to manage one's own learning and identify own learning needs. (1) Since doctors are required to be life-long learners, it is important that medical students develop SRL skills as early as possible. (2) Extensive literature has addressed the elements required of a self-regulated learner; (3,4) however, little has addressed how students can be supported to develop these skills and the impacting factors, particularly the impact of transitioning to university. Medical students are an interesting cohort as they are typically high-achievers at school, have the development of a professional identity forming when they start university, and a clear professional outcome to their studies. It is important that medical schools can support their students through this transition to university, to consequently improve student abilities to self-regulate their learning. (5)

In the medical school being studied, the teaching approach changes between the first and second semester of first year. The first semester being a strongly didactic 'Platform for Clinical Sciences' (PCS), the second semester adopting a 'Case-Based Learning' (CBL) approach. The students therefore potentially have to adapt to two different curriculum formats.

Methods

The aim of the project was to investigate participants’ lived experiences, so a qualitative approach was adopted using open intensive interviews. The initial interview questions were taken from previous interviews carried out by my supervisor (6) and had been extensively piloted through this process. Participants were recruited from the first-year cohort of the medical school at the beginning of the academic year, and interviewed individually at two points; once during the first semester and again during the second semester. This enabled the development of the participants to be tracked across the year, and compared between the two different teaching approaches.
The data were analysed using a constructivist Grounded Theory approach, meaning that any theories generated were not pre-conceived, but emerged from the data. (7) Analysis of the data by coding using NVivo 11 software began whilst gathering the data (a key tenet of Grounded Theory) and continued as an iterative process of going back and forth between the data and analysis using comparative methods until data saturation was reached. Coding of the first cycle of interviews informed the development of interview questions for the second set of interviews.

Ethical approval was obtained from the local research ethics committee and preparations were made to support students who reported issue of concerns or became distressed during the interview.

Results

Figure 1: The 6 themes derived from the data. The lines between them demonstrate the linkages between themes and those that overlap.

The study followed 15 participants. Approximately 300 codes were derived from analysis of the interviews, focused into 6 main themes (see Figure 1).

Conversely throughout the second interviews, participant self-assurance seemed to have increased, alongside a greater ability to identify own learning needs. Most participants displayed an increased willingness to help their peers rather than compete. Collaboration seemed to be a key factor of importance in students adapting their ability to self-regulate, and overall enjoyment seemed to increase whilst stress decreased.

Discussion

Most students were already effective at SRL when starting university, however they struggled to adapt it to their new environment. Some did this successfully, some less so. Students seemed to cope with adapting their SRL in different ways; for example, this project highlighted the significance of transition and identity in student development in their first year of university. SRL effectiveness was not measured, however, the participants’ perceptions of efficacy were noted. Uncertainty with regards to what was required of them during their first term led to increased stress and comparison amongst them, this competitive element of the hidden curriculum has been noted in studies previously. (8)

This study showed how medical student identities change across their first year. Lack of confidence in the first semester emphasised the students’ novice status within the medical community, whereas the second semester introduced skills associated with ‘being a doctor’, enabling students to progress towards forming a professional identity and work with others. Developing these relationships with peers is vital if students are to succeed. (9)

Medical schools should be developing curricula that facilitate students’ development of professional identity. (10) Not only to assist with SRL skills but to also help promote resilience and coping strategies. It would be beneficial to run a parallel study in a medical school that does not change its curriculum, to compare how much of the development of students was a consequence of the change in course structure.

Lessons Learnt

This study was an interview-based research project, a method new to me before starting my intercalation. I found the project challenging, but it was enjoyable and rewarding talking about student’s experiences, and I was glad that participants found sharing their stories beneficial.
I learnt the benefit of using qualitative research in being able to see individual stories and investigating ‘lived experiences’ in more detail than possible with a quantitative approach. I learnt the skills of being able to draw out conclusions from similarities between participant data.

Constructivist Grounded Theory was an advanced method of analysis to use, however it allowed me to go down the richest route of the data, teaching me the importance of being adaptable in research. The huge amount of data collected taught me to be concise in my write-up. PCS and CBL posed different challenges to students, with PCS being particularly difficult. Consequently, the work from this project is being sought after from the medical school to inform their review of the curriculum of Year 1.

My experience throughout has encouraged me to become involved in medical education research in the future, as well as improving my communication skills for working with patients and medical students alike. Due to the success of the project we are carrying on the study with the participants into their second year of medical school. I look forward to taking our study onto the next step and continuing my involvement in medical education.
