Evidence Implications:

Clinical:

The frameworks identified may provide adequate coverage of subjects and competencies to inform a Wales-wide multidisciplinary competency framework for adult specialist palliative care workforce.

Policy:

Will contribute to providing a standardised training framework for organisations to implement, regulate and continuously evaluate.

Glossary:

EAPC—European Association for Palliative Care
EOLB—End of Life Board
HEE—Health Education England
PEOLC—Palliative and End of Life Care

Context

Provision of palliative and end of life care (PEOLC) education is a crucial core component of providing an effective, multidisciplinary workforce. Education frameworks identify specific learning needs, promote consistent, inclusive, and flexible approaches to education, address discipline specific standards and support learning and development at individual, service and organisational levels. For education programmes to be effective, training needs to be consistent and available. Currently, England, Scotland and Ireland have a country-specific standardised competency framework for the education of the palliative care workforce, but Wales does not. Also, a recent service evaluation in Cardiff and the Vale has identified areas of inequity regarding standardised PEOLC education.

The End of Life Board (EOLB) in Wales has prioritised the need for an all-Wales strategy to PEOLC education and to identify whether an already established competency framework may work, or whether a Wales specific framework may be required. This rapid review will aim to identify any established PEOLC education frameworks from the published literature and map the core domains and competencies included within them. The findings will then be used by C&V UHB and EOLB to inform a Wales specific PEOLC education core competency framework.

Key findings

Database and supplementary searches generated 152 records in total. After removing duplicates and irrelevant records, 84 articles were screened for eligibility. Figure 1 shows the flow of information through the review. We assessed 18 full text articles for the inclusion of a competency framework for end-of-life care education, but 10 of these were excluded due to not containing enough detail about competencies within their framework. A mapping exercise was carried out, whereby competencies from frameworks in the included articles, were mapped to the European Association for Palliative Care (EAPC) ten core competencies (Table 1). These competencies were derived from a consensus process and are detailed in ‘Core competencies in palliative care: an EAPC White Paper on palliative care education – part 1’ and ‘Core competencies in palliative care: an EAPC White Paper on palliative care education – part 2’. These were chosen as the mapping base due to the topics covered, and they aim to complement skills and attitudes that healthcare professionals have already attained through clinical practice. Any gaps identified within the other frameworks and not covered by the EAPC are reported.

Two reviewers cross checked and discussed competencies extracted and mapped these across the framework. The full mapping is available as a supplementary document, upon request.

Eight frameworks were included. Two were based in the UK (Scotland and England), 3 in the USA and 2 in Canada and 1 in Ireland. Six frameworks were aimed at multidisciplinary palliative care teams, 1 at multidisciplinary care in nursing homes and 1 at community volunteer navigators. Five frameworks covered all aspects of care, whereas 2 frameworks focused specifically on communication skills and topics
What competency frameworks are available to promote a consistent education framework for palliative and end of life care workforce in Wales?

**Definition of competency:** We defined a competency as ‘a cluster of related knowledge, skills and attitudes that affects a major part of one’s job (a role or responsibility), that correlates with performance on the job, that can be measured against well-accepted standards, and that can be improved via training and development’ (Parry, S. B. (1996).

**Relevance of evidence**

Some of the studies were carried out in the USA, where the health care system is not necessarily comparable to the UK and therefore, have limited generalisability to Wales. However, the main principles behind palliative and end of life care do remain consistent between countries and therefore, will still be useful to consider, when designing a competency framework.
Review Methods

Search Strategy: A search was conducted across a wide-ranging set of databases: Ovid Medline, including In-Process & Other Non-Indexed Citations, HMIC, Scopus and Social Policy and Practice. The preliminary search strategy was developed on Ovid Medline using both text words and medical subject headings and restricted to English language humans. The search strategy was modified to capture indexing systems of the other databases. (Search strategies available upon request).

Reference lists of systematic reviews were checked for relevant studies. Overall, the searches generated 84 citations after removing duplicates and irrelevant records. Figure 1 represents the flow of information through the different phases of the review.

Inclusion: Any competency or capability frameworks for adult palliative and/or end of life care. Healthcare systems similar to the UK.

Exclusion: Any competency or capability frameworks for paediatric palliative care. Competency frameworks with no defined curriculum.

Study selection/Quality Assessment/Data Extraction: Study selection was based upon review of the abstract by two independent reviewers. The full text was then assessed independently using a pre-designed eligibility form according to inclusion criteria. Data extraction was carried out by one reviewer and checked by another using a pre-specified data extraction form.

Quality assessment was not undertaken due to the type of the topic and research question.

Any discrepancies between the two reviewers were resolved by consensus or by recourse to a third reviewer.

*NHS Education for Scotland competencies mapped for the ‘informed’ level, defined as: “Informed level outlines the knowledge and skills required by all health and social service workers in relation to palliative and end of life care”

**Health Education England competencies mapped for ‘Tier 2’ defined as: “Health and social care professionals who require some knowledge of how to provide person-centred, high-quality end-of-life care as they often encounter individuals who need such support within their working environment”
