#### Abstract

This project required developing new practical routes towards pyrroles and could help the project of total synthesis of (-)-rhazinilam. In chapter one, the most widely used methods for constructing the pyrrole ring system are reviewed. The origins of this project were to investigate further uses for the iodocyclization reactions developed previously. In chapter 2, a new approach to such highly substituted pyrroles in which the key step is a 5 -endo-dig halocyclisation of substituted homopropargylic sulfonamides was successfully achieved. Key to the success of this novel method is the rapid preparation of suitable starting materials, from 1-alkynes by sequential formylation and condensation with a tin(II) enolate of $N$-tosyl glycinate.

Also, in chapter 2, a transition metal-catalyzed cyclisation using silica-supported silver nitrate was investigated and found to be effective. The reaction is clean and proceeds in quantitative yields. Obviously this fundamental research project is of a great interest because (-)-rhazinilam acts as an antimitotic agent like taxol, which are powerful anticancer agents. Different strategies of this approach are reviewed in chapter 3.

In chapter 4 and 5, various aspects of separate approaches to the anti-tumor compound rhazinilam are described. In the former, both the synthesis of suitable 3-arylpyrrole cores and strategies for extending this methodology by the incorporation of a suitable substituent based on a cleavable cyclohexene are outlined. In the second section, chapter 5, similar issues are addressed but, in contrast, the $\mathrm{Ag}(\mathrm{I})$ methodology is used to construct a suitable arylpyrrole, the synthesis of which also features construction of the key precusor by aziridine ring hydrolysis. An efficient route to an enantiopure precusor of the necessary side chain is also described.

This thesis is completed by a full experimental section and reference list.

## Acknowledgements

I would like to take this opportunity to thank my supervisor Professor David W. Knight for his enthusiasm, guidance and support throughout this project. I am very grateful to all members of the academic staff and the technicians of the chemistry department at Cardiff university, especially Mr. Rob Jenkins and Rob for their assistance and to Prof.Knight's secretary, Mrs Fran Godwin, for her encouragement and constant support.

I would like also to thank Dr. K. M. A. Malik and Dr. Liling Ooi for their help on the X-ray crytal structures; all other students of the department, past and present, especially Chris, Lilian, Amjad, John, Emily, Nick, Mel, Xu, Charlie boy, Ian, Heizi, Lars, Shaista, and any others for making my time at Cardiff so pleasurable. I am so grateful to my great friends, Charlie, Siân and Nigel for proofreading my Thai-english thesis.

I must thank my family for their great support; my mother for her belief, my father for his encouragement, my sister and my brother for their enthusiasm, and finally my sweetest guy, Edmond for being here and helped me through a difficult time in my life.

Finally, I could not make it without the help from Royal Thai Government and EPRSC for financial support.

Thank you so much.
JIRADA

## CONTENTS

Chapter one: Classical Pyrrole Syntheses
1.1 Introduction ..... 1
1.2 Synthesis of pyrroles ..... 1
1.2.1 Paal-Knorr synthesis ..... 2
1.2.2 Knorr synthesis ..... 3
1.2.3 Hantzsch synthesis ..... 5
1.2.4 By using dipoles ..... 6
1.2.5 From 1,3-dicarbonyl compounds and glycine esters ..... 8
1.2.6 Synthesis by reduction of exiting rings ..... 9

## Chapter 1

## Classical Pyrrole Syntheses

### 1.1 Introduction

Many heterocyclic compounds are biosynthesized by plants and animals and many are biologically active. These compounds play a vital role in life, medicine and industry. The biological properties of heterocycles make them of prime interest to the pharmaceutical and biotechnology industries. Our interest focuses on one of the most important groups of heterocycles, the five-membered cyclic compounds based upon the pyrrole nucleus 1 .

 [1H-pyrrole] 1

porphobilinogen 2

Figure 1.1

Pyrrole $^{1}$ is commercially available, and is manufactured by alumina-catalysed gas-phase reaction of furan with ammonia. Pyrroles are fundamental to life; compounds such as haemderivatives in blood, the chlorophylls essential for photosynthesis, and related natural products such as vitamin $\mathrm{B}_{12}$, all play key roles in general metabolism. Chlorophyll and haem are synthesised in living cells from porphobilinogen 2, the only pyrrole to play a function in fundamental metabolism. These compounds provided the impetus for much of the early work on the preparation and reactions of pyrroles. The synthesis of pyrroles related to these naturally occurring complex molecules continues to be a very active area of research, in which the natural structures have inspired the design and preparation of potentially bioactive but non-natural derivatives.

### 1.2 Synthesis of pyrroles

This review focuses on the syntheses of highly substituted pyrroles and the more commonly used methods. When the formation of pyrrole is considered retrosynthetically, it exhibits the function of a double enamine and can be dissected retroanalytically in three major ways (from A, see Figure 1.2). The classical pyrrole syntheses usually involve polar cyclo-
condensations in which nucleophilic and electrophilic centers react through one or more addition-elimination steps. Usually, nitrogen and/or the nucleophilic carbon of an enol, enolate or enamine are the nucleophilic components. A carbonyl, an imine, or an electrondeficient carbon-carbon double bond is usually the electrophilic component.

Paal-Knorr synthesis

F
Hantzsch synthesis

Knorr synthesis

Figure 1.2: Retrosynthesis of pyrrole.

### 1.2.1 Paal-Knorr synthesis

1,4-Dicarbonyl compounds, 3, react with ammonia or primary amines to give pyrroles. Successive nucleophilic additions of the amine nitrogen to the two carbonyl carbon atoms and the loss of two equivalents of water represent the net course of the synthesis; a reasonable sequence for this is shown below in the synthesis of 2,5-dimethylpyrrole, 8 (Scheme 1.1 ). ${ }^{2} \mathrm{~A}$ variety of more complex 1,4-dicarbonyl compounds have been used in the synthesis of substituted pyrroles.

Scheme 1.1

### 1.2.2 Knorr synthesis

This widely used, general approach to pyrroles utilizes two components: an $\alpha$-aminocarbonyl component 9 , which supplies the nitrogen, $\mathrm{C}-2$ and $\mathrm{C}-3$, and a second component which supplies C-4 and C-5, and which must have an activated C-H bond adjacent to a ketone such as the $\beta$-keto ester 10 shown below (Scheme 1.2). The cyclisation normally proceeds by an initial enamine formation. However, in general, only 3-carboxy- or 3-acylpyrroles can be made using this method.

Scheme 1.2

A way of avoiding the difficulty of handling $\alpha$-aminocarbonyl compounds is to prepare them in the presence of the second component with which they are to react. For example, zincacetic acid or sodium dithionite ${ }^{3}$ can be used to selectively reduce an oxime group to an amine, leaving ketone and ester groups untouched (Scheme 1.3). Thus, such a selective reduction of the pyruvaldehyde monoxime $\mathbf{1 2}$ is possible in the presence of ethyl acetoacetate 13 to give the amino ketone 14 and then the pyrrole 15.

## Scheme 1.3

Another interesting example in which two pyrrole rings are formed using phenylhydrazone 17 as a precursor of the $\alpha$-aminocarbonyl component is illustrated in Scheme 1.4. ${ }^{4}$ Although the yield of the pyrrole $\mathbf{1 8}$ is relatively poor, this is not so low considering the number of transformations involved.

Scheme 1.4

Modern alternatives for the assembly of the $\alpha$-aminocarbonyl components feature the reaction of a Weinreb amide of an $N$-protected $\alpha$-amino acid 19 with a Grignard reagent to form an $N$-protected amino ketone 20. Release of the amino group in the presence of the second component, ethyl acetoacetate 13, enables the desired condensation leading to the pyrrole to compete effectively with self-condensation of the free amino-ketone (Scheme 1.5). ${ }^{5}$

Scheme 1.5

In a related alternative, the enamine 24 , produced by the addition of an $\alpha$-amino ester 22 to dimethyl acetylenedicarboxylate 23, form 3-hydroxypyrroles 25 by a Claisen Ester-type ring closure (Scheme 1.6). ${ }^{6}$

## Scheme 1.6

### 1.2.3 Hantzsch synthesis

As a modification of the Feist-Benary synthesis of furans, ammonia or a primary amine is incorporated. This strategy employs an $\alpha$-halocarbonyl compound 26, a $\beta$-keto-ester 27 and ammonia. ${ }^{7}$

## Scheme 1.7

Similar intermediates can also be obtained when the keto carbene 33, formed from the decomposition of $\alpha$-diazoketone 32 in the presence of copper(II) acetylacetonate, is reacted with stabilized enaminone $\mathbf{3 1}$ to give pyrroles $\mathbf{3 5}$, as shown in Scheme 1.8. ${ }^{8}$

Scheme 1.8

Trofimov and co-workers ${ }^{9}$ have developed a pyrrole synthesis that involves reactions of ketoximes $\mathbf{3 6}$ with alkynes under strongly basic conditions. A sigmatropic rearrangement of the resulting $O$-vinyloximes 37 is a key step in this reaction, which is then followed by a typical imine-carbonyl condensation.

Scheme 1.9
1.2.4 By using dipoles with a potential leaving group, cycloadditions can lead directly to pyrroles. Appropriate dipolarophiles include unsaturated ketones, esters, nitriles, and nitro compounds, as well as electrophilic alkynes.

## The van Leusen synthesis

The tosylmethyl isocyanide 40 reacts with the $\alpha, \beta$-unsaturated ketone 41 , as well as with related ketones or sulfones, by Michael addition; subsequent closure onto the isocyanide carbon then generates the cyclic imine 43. Subsequent loss of toluenesulfinate ${ }^{10}$ from intermediate 44 and tautomerisation to the aromatic system of pyrrole 46 then completes the synthesis (Scheme 1.10).

Scheme 1.10

## The Barton-Zard synthesis

Nitroalkenes are useful reactants for isocyanoacetates, with pyrroles being formed by elimination of nitrous acid (Scheme 1.11). ${ }^{11}$

## Scheme 1.11

## The cycloaddition of oxazolium oxides

Dehydration of $N$-acylamino acids can be carried out by heating an $\alpha$-amino acid in acetic anhydride to generate azalactones 51. In the presence of a dipolarophile such as dimethyl acetylene dicarboxylate 23, an unstable adduct 53 is presumably formed, which then undergoes decarboxylation to provide a pyrrole 54 (Scheme 1.12). ${ }^{12}$ Although this synthesis is efficient, it is limited to electron-deficient alkynes.

Scheme 1.12

### 1.2.5 From 1,3-dicarbonyl compounds and glycine esters

1,3-Dicarbonyl compounds and their synthetic equivalents can give pyrroles by condensation with amines that possess an $\alpha$-electron-withdrawing substituent, such as an ester or a ketone. Such condensations have the potential for producing two isomeric products when the dicarbonyl component is unsymmetrical. The regioselectivity is usually governed by an initial condensation of the amino group with the more reactive carbonyl group. The simplest is condensation using triethylamine as base to produce an intermediate enamino-ketone 57, which then undergoes ring closure in a second step (Scheme 1.13). ${ }^{13}$

Scheme 1.13

## The Kenner synthesis

By Michael addition and a similar intramolecular aldol condensation, an $\alpha, \beta$-unsaturated ketone $\mathbf{5 9}$, generates compound $\mathbf{6 1}$; subsequent chlorination and elimination forms compound 62. The pyrrole oxidation level is achieved by treating compound 62 with DBU. The tosyl group is eliminated as toluensulfinate (Scheme 1.14). ${ }^{14}$

Scheme 1.14

### 1.2.6 Synthesis by reduction of existing rings

Pyrroles can be obtained by reduction of 1,2-diazines 66. This reaction has been used in conjunction with inverse electron demand Diels-Alder reactions. Herein, the use of alkynes 65, as the dienophile, and a tetrazine 64 allows for the synthesis of 3-alkylpyrrole-2,5dicarboxylate ester 67, as shown in Scheme 1.15. ${ }^{15}$

## Scheme 1.15

Reductive formation of pyrroles ${ }^{16}$ from pyrrolenones is also feasible. For example, Dibal-H reduction of 4-alkoxy-3-pyrrolin-2-ones 70 provides a route to 3-alkoxypyrroles 71.

Scheme 1.16

### 1.2.7 Metal-mediated cyclizations

1-Aminomethyl-1-alkynyl carbinols 72 are cyclized to pyrroles by palladium(II) salts, ${ }^{17}$ which presumably form electrophilic palladium(II)-alkyne complexes, which then aromatize by the elimination of palladium(II) and water from intermidiate 73, as shown below.

Scheme 1.17
$\alpha, \beta$-Unsaturated imines 75 react with esters 76 to give pyrrole derivatives 79 in the presence of $\mathrm{NbCl}_{3}{ }^{18}$ Presumably, the niobium functions both to form a complex 77 and to effect the reductive formation of the $\mathrm{C}-\mathrm{C}$ bond.

## Scheme 1.18

### 1.2.8 Electrophile-induced cyclisation

Samarium(II) iodide is a reagent for single electron transfer and, in this case, the single electron is delivered to nitro compounds $\mathbf{8 2}$, which then form a samarium radical 84 . The radical 84 then reacts in a Michael fashion with the unsaturated imine 83, generated from aldehydes $\mathbf{8 0}$ and amine 81, to give pyrrole derivative $\mathbf{8 8}$ (Scheme 1.19). ${ }^{19}$

Scheme 1.19

The 5-endo-dig closure of 4-tosylaminoalkynes $\mathbf{8 9}$ generates dihydropyrroles $\mathbf{9 0}$; the elimination of toluenesulfinate then produces the aromatic system, the pyrroles $91 .{ }^{20}$

Scheme 1.20

### 1.3 5-endo-dig cyclisation

Baldwin's rules ${ }^{21}$ are based on the stereochemical requirements for the transition states of the various tetrahedral, trigonal, and digonal ring closure processes. The ring forming process is described with the prefix exo, when the breaking bond is exocyclic to the smallest forming ring, and endo when the bond that breaks is endocyclic. The favoured ring closures are determined by the length and nature of the linking chain, which enables the achievement of the required trajectories for the terminal atoms to form the final ring bond, as illustrated in Figure 1.3. In the disfavoured cases, bond angles and distances require severe distortion to achieve such trajectories; alternative reaction pathways can then dominate and the desired ring closures will be difficult.

Figure 1.3: the digonal case

Since Heilbron and co-workers ${ }^{22}$ reported the preparation of 2,5-dimethylfuran from 3-hexen5 -yn-2-ol, by the catalytic action of mercuric sulphate, substituted furans have been synthesized from acetylenic intermediates. Further, palladium catalysts have been found to be effective for the intramolecular addition of an amine, or an alcohol to an acetylene (Scheme 1.17). ${ }^{17}$

The recently developed methods for the overall 5-endo-dig cyclization of 3-alkyne-1,2-diols to give $\beta$-iodofurans ${ }^{23}$ have opened up a new approach to iodopyrroles, ${ }^{20}$ by inducing iodocyclization of sulfonamides upon treatment with three equivalents each of iodine and base in acetonitrile, followed by elimination of $p$-toluenesulfinic acid using 2.1 equivalents
of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU); this was successful when R was a simple alkyl or aryl group (Scheme 1.20).

According to this system, the iodine atom can readily be used as a handle for further elaboration, making it easy to make more highly-substituted pyrroles. For instance, the $\beta$ -iodo-dihydropyrroles 92 have been shown to undergo Sonogashira palladium-catalyzed coupling reactions (Scheme 1.21).

## Scheme 1.21

Although favoured processes, 5-endo-dig cyclizations to achieve pyrroles have scarcely been reported in the literature. However, other groups have used related ring closing reactions. In 1984, Larock ${ }^{24 a}$ reported the cyclization of nitrogen-containing aryl acetylenes to mercurated indoles. This used one equivalent of mercuric acetate in acetic acid for 30 min at room temperature followed by an aqueous sodium chloride workup (Scheme 1.22). Larock ${ }^{24 a}$ suggested that the anticipated heterocyclic mercurials were readily protodemercurated by acetic acid present in the reaction mixture.

97
Scheme 1.22

A more recent application of 5-endo-dig mercury-cyclisation was employed during a synthesis of the natural product $(+)$-preussin $\mathbf{1 0 0} .{ }^{24 b}$ Despite conjugation to the keto group,
the alkyne 98 remains sufficiently nucleophilic to interact with the electrophilic mercury. The intermediate ketone 99 is stable to racemization and the N -Boc group did not interfere.

Scheme 1.23

In 2000, Knochel $^{25}$ reported a 5 -endo-dig cyclisation of ortho-alkynylanilines $\mathbf{1 0 1}$ to give indoles 102. This cyclisation was achieved using caesium or potassium bases in N methylpyrrolidinone (NMP), as shown in Scheme 1.24.

Scheme 1.24

### 1.3.1 Iodocyclisation

The advantage of the 5-endo-dig methodology is that the formation of the heterocycle is an intramolecular reaction, the competing reactions are Baldwin disfavoured 4-exo-dig cyclizations and, in the case of iodocyclization, addition of iodine across the triple bond. The described classical methods, except for the Paal-Knorr synthesis, require the condensation of two smaller fragments, which can lead to problems of regioselectivity. The fragments can also cause problems in their own right. They may be highly reactive, unstable and harmful intermediates, for example isocyanides.

Following on from the successful results of Knight and Redfern in $1998^{20}$ in preparing the dihydropyrroles 90 and pyrroles 91 by iodocyclization (Scheme 1.20), it was a primary aim of this present project to assess the practical applications of the methodology already developed and study various applications. According to the formation of the starting
materials, Redfern had presented the best results, achieved for individual steps as shown in Scheme 1.25.

i)leq. Benzophenone imine, DCM, $25^{\circ} \mathrm{C}, 48 \mathrm{~h}, 99 \%$; ii) 3eq. $\mathrm{K}_{2} \mathrm{CO}_{3}, 0.1$ eq. $\mathrm{Bu}_{4} \mathrm{NI}$, 2.2eq. propargyl bromide, MeCN , reflux, 16 h ; iii) 2 M HCl (aq.) $/ \mathrm{Et}_{2} \mathrm{O}, 25^{\circ} \mathrm{C}, 1.5 \mathrm{~h}, 83 \%$ ( 2 steps); iv) 1.1 eq. tosyl chloride, DMAP (cat.), 1.5 eq. $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCM}, 25^{\circ} \mathrm{C}, 16 \mathrm{~h}, 96 \%$; v) $1.2 \mathrm{eq} . \mathrm{ArX}$, 0.05 eq. CuI, 0.05 eq. $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4} \mathrm{Pd}(0), \mathrm{Et}_{2} \mathrm{NH}$, reflux, $16 \mathrm{~h}, 77-92 \%$.

## Scheme 1.25

Steps i) and iv) were reliably good. However, it was a major drawback to synthesize the acetylenic-amino ester $\mathbf{8 9}$ from glycine methyl ester hydrochloride $\mathbf{1 0 3}$ due to requirement of the propargyl glycine 107 in large amounts. The glycines 107, at best, gave $83 \%$ combined yields (from compound 104), but these were often $20-30 \%$. The problem step is the protecting group exchange, seemingly at the $N$-tosylation stage. The Sonogashira cross coupling (step v) was variable, being dependent upon the purity of the propargyl glycine 107; it also required a considerable mass of $\left(\mathrm{Ph}_{3} \mathrm{P}\right)_{4} \mathrm{Pd}(0)$.

Exposure of the sulfonamides $\mathbf{8 9}$ to three equivalents of $\mathrm{I}_{2}$ and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in dry acetonitrile at room temperature resulted in slow but clean cyclisation to give excellent isolated yields (71$78 \%$ ) of the iododihydropyrroles 90 (Scheme 1.20), suggesting that will be prove to be useful synthetic intermediates. These aspects and further studies of the scope and this chemistry are then being pursued.

i) $\mathrm{HCCCH}_{2} \mathrm{MgBr}, \mathrm{HgCl}_{2}, \mathrm{CuCl}, \mathrm{Et}_{2} \mathrm{O}, 20^{\circ} \mathrm{C}, 16$ h; ii) a) BuLi, THF, $-78^{\circ} \mathrm{C}$ then add $\left(\mathrm{CH}_{2} \mathrm{O}\right)_{\mathrm{n}}$, warm to $20^{\circ} \mathrm{C}, 16 \mathrm{~h}$; b) NBS, $\mathrm{PPh}_{3}, \mathrm{DMF},-30^{\circ} \mathrm{C}$; iii) LDA, THF, $-78^{\circ} \mathrm{C}$ then add bromide and slowly warm to $20^{\circ} \mathrm{C}$; iv) a) $1 \mathrm{M} \mathrm{HCl}, \mathrm{Et}_{2} \mathrm{O}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$; b) $\mathrm{TsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMAP}, \mathrm{DCM}, 20^{\circ} \mathrm{C}$, 16h.

## Scheme 1.26

Later, in $1999^{26}$, Fagan and Knight reported an alternative method to prepare the key starting materials 114, in which the enolate of $N$-benzylidene glycinate 112 was reacted with the propargylic bromide 111 to give compound 114 in good overall yields (Scheme 1.26). However, a lengthy synthesis is still involved and would in any case detract from the synthetic utility of the scheme.

Treatment of this enynoate 114 with iodine in dry acetonitrile in the presence of potassium gave $60 \%$ isolated yields of the expected iodo-dihydropyrrole 115, which was then treated with DBU to give the iodopyrrole 116 in $90 \%$ yield (Scheme 1.27).

$\xrightarrow[90 \%]{\substack{\text { DBU, DMF } \\ 20^{\circ} \mathrm{C}, 16 \mathrm{~h}}}$

Scheme 1.27

We reasoned that, by working at a higher oxidation level, the whole process could be made more efficient. A new route was suggested, based on the report of Kazmaier et al. ${ }^{27}$ This group reported the addition of $\operatorname{tin}$ (II)-chelated amino ester enolates 117 to conjugated alkynyl aldehydes 118 to give $\alpha$-amino- $\beta$-hydroxy ester 119 (Scheme 1.28).

Scheme 1.28

In fact, as we were intending to form pyrroles eventually, and thus destroying the stereogenic centers, the diastereoselectivity of the reaction was unimportant to us. This would also have the great advantage of avoiding the protecting group exchange, which is a weak step in the previous approaches described above (Scheme 1.25 and 1.26).

The idea was to develop a synthesis of the iodopyrroles 118 , which could be formed by the elimination of water from the 3-hydroxy-2,3-dihydropyrroles 119, prepared by iodocyclization of the $\alpha$-amino- $\beta$-hydroxy esters $\mathbf{1 2 0}$ (Scheme 1.29).

Scheme 1.29

Following on from an aldol addition of an enolate $\mathbf{1 2 1}$ of glycinate to an acetylenic aldehyde 122, all that was now required was a facile synthesis of such acetylenic aldehydes in order to access a quantity of the $\alpha$-amino- $\beta$-hydroxy esters 120. Accordingly, we found that Larsen ${ }^{28}$
had reported a successful formylation methodology to achieve an excellent yield of acetylenic aldehydes $\mathbf{1 2 2}$ from terminal acetylene $\mathbf{1 2 3}$ by using $10 \%$ aqueous potassium dihydrogen phosphate in a reverse work-up, as outlined below.

### 1.3.2 Synthesis of $\beta$-hydroxy- $\alpha$-amino esters

$\beta$-hydroxy- $\alpha$-amino esters are the key starting material in our cyclisations. In fact, $N$ protected $\beta$-hydroxy- $\alpha$-amino esters are very important compounds in synthetic organic chemistry. They are interesting as intermediates in natural product synthesis and as starting materials for nitrogen-containing heterocycles; amongst many other potential applications. ${ }^{29}$

### 1.3.2.1 Glycine Enolate Aldol Reactions

Reactions of glycine derivatives have proven particularly successful. The aldol reaction plays an especially significant role, since it leads to the important class of $\beta$-hydroxy- $\alpha$-amino acids. The development of the glycine enolate and its participation in the desired aldol bond construction (Figure 1.4) was established well by Bold's work in 1989. ${ }^{30}$

Figure 1.4: Aldol bond construction of $\beta$-hydroxy- $\alpha$-amino acids.

Bold applied titanium complex $\mathbf{1 2 9}$ to achieve stereochemical control in condensations of lithium enolates of $N$-bis-silylated glycine esters 128, however only moderate yields (43-70\%) and levels of syn-diastereoselectivity ( $87-98 \%$ ) of $\beta$-hydroxy- $\alpha$-amino acid esters were observed (Scheme 1.30).

127

Scheme 1.30

The chelated enolates $\mathbf{1 3 0}$ show higher stability than the corresponding lithium enolates $\mathbf{1 2 8}$. In addition, because of the fixed enolate geometry, their reactions are more selective than those of the lithium enolates. In 1993, a very high diastereoselectivity of $>99 \%$ was obtained in the reaction of $N$-benzylideneglycinate 131 in the presence of one equivalent of $\mathrm{TiCl}_{2}(\mathrm{OPr}-$ $i)_{2}$ with pivaldehyde $\mathbf{1 3 3}$ (Scheme 1.31). ${ }^{31}$ This high anti-selectivity was only observed when bulky aldehyde acceptors were employed.

Scheme 1.31

Kazmaier and co-workers ${ }^{32}$ reported a high anti-diastereoselectivity in the aldol reactions of $N$ - (benzyloxycarbonyl)-protected amino acid esters $\mathbf{1 3 5}$ with aliphatic aldehydes, which were
obtained by adding 2.5 equivalents of $\mathrm{TiCl}(\mathrm{OPr}-i)_{3}$. This study also showed similar results with other chelating metals such as $\mathrm{ZnCl}_{2}, \mathrm{MgCl}_{2}, \mathrm{Al}(\mathrm{OPr}-i)_{3}, \mathrm{NiCl}_{2}$ and $\mathrm{CoCl}_{2}$. In contrast, the addition of 2.5 equivalents of $\mathrm{SnCl}_{2}$ led to extremely high diastereoselectivity and improved yields (Scheme 1.32). Also, both $N$-tosyl and benzyl esters of alanine could be used to obtain the anti-diastereoisomers; however, this was not applicable to aromatic aldehydes.

## Scheme 1.32

In 1998, ${ }^{27}$ they presented the results of aldol reactions of tin enolates of N -(methylphenylsulfonyl)-protected amino acid esters 137 with various aromatic aldehydes (Scheme 1.33). The tosyl-protecting group proved to be particularly valuable in such aldol reactions of tin chelated enolates, concerning both yield (60-91\%) and antidiastereoselectivity (85-99\%) of $\beta$-hydroxy- $\alpha$-amino acid esters 139.

1.2 eq. ArCHO

syn-139

Scheme 1.33

Deprotonation of $N$-tosyl alanine ester 137 with LDA at $-78^{\circ} \mathrm{C}$ and subsequent addition of $\mathrm{SnCl}_{2}$ presumably results in the formation of chelated enolate 138, which is then trapped with the aldehyde. It became clear that condensation of the tin enolates 138 with the aldehyde required at least two equivalents of $\operatorname{tin}$ (II) chloride to achieve good selectivity. This high antidiastereoselectivity arises from the fixed enolate geometry and chelation control on the
aldehyde (Figure 1.5). Complex 140 is more favorable than complex 142, presumably because of steric hindrance between the R group and the $N$-tosyl, and/or the R group and Me group.

Figure 1.5

Later, Kazmaier ${ }^{33}$ showed the aldol reactions of tosylated amino acid ester enolates $\mathbf{1 4 5}$ with chiral aldehydes $\mathbf{1 4 7}$ give rise to polyhydroxylated amino acid esters 148 with high levels of stereoselectivity (Scheme 2.4).

Scheme 1.34

In contrast, the reaction of glycine enolates 146 gave a 1:1 diastereomeric mixture at the $\alpha$ center of polyhydroxylated amino acid esters 149 , probably because of epimerization. This inversion of configuration can be explained by examining the planar enolate 152, where the hydrogen can be delivered from the left face $\mathbf{1 5 1}$ or from the right face $\mathbf{1 5 3}$ (Figure 1.6).

Figure 1.6

### 1.3.2.2 Retrosynthesis Analysis

According to our projected 5-endo dig cyclisation, this methodology could be applied to achieve our key precursors, alkynyl- $\beta$-hydroxy- $\alpha$-amino esters 120, by condensations between $N$-tosyl protection amino esters 154 and $\alpha, \beta$-acetylenic aldehydes 122 (Figure 1.7). We proposed this route to obtain any diastereoisomers, which was of little concern, as both stereogenic centers would be destroyed to form pyrroles eventually, we anticipated.

Figure 1.7

This requires a facile synthesis of the aldehydes 122. Larsen reported in 1989 that the direct formylation of an acetylide with DMF gave excellent yields of $\alpha, \beta$-acetylenic aldehyde 122, but only when the intermediate hemiaminal salts $\mathbf{1 5 5}$ are decomposed in such a way as to prevent various side reactions (Scheme 1.35). ${ }^{28}$

## Scheme 1.35

In fact, the intermediate $\mathbf{1 5 5}$ could release the strong nucleophile dimethylamide $\mathbf{1 5 9}$, which can subsequently react with the alkynal 122 to form Michael adduct 156; this could then react with more nucleophilic dimethylamide to form the iminium salt 157 which could then form the ketone $\mathbf{1 5 8}$ (Scheme 1.36).

Scheme 1.36

The possibility of these side reaction was eliminated by a reverse quench into a monobasic phosphate solution, trapping the dimethylamine as its salt, to afford the $\alpha, \beta$-acetylenic aldehydes $\mathbf{1 2 2}$ without any trace of Michael adducts 156, 157 and 158 (Scheme 1.34).

### 1.3.2.3 Initial Studies

Indeed, the aldol condensation was smoothly applied to condense the acetylenic aldehydes 122 and the glycinate enolate 121 in very useful levels of anti-stereoselection and yields, as shown briefly in Scheme 1.37 (see Chapter 2). ${ }^{34}$

## Scheme 1.37

This provided a methodology to access our key precursors, the $\alpha$-amino- $\beta$-hydroxy esters $\mathbf{1 2 0}$. Surprisingly, the results of Kazmaier's study suggested very low stereoselectivity would be obtained at the new $\alpha$-position by using glycine enolate. ${ }^{27}$ This was reasoned to be due to epimerization under the reaction conditions, assisted by acidification of the $\alpha$-position by the electron withdrawing sulfonyl and especially ester functionalities.

In addition, Sharland had studied this 5-endo-cyclisation methodology with various conjugated ynals, and achieved a broader application in order to prepare highly substituted pyrroles, as shown in Table 1.1. ${ }^{35 \mathrm{a}}$ These results were taken together with those obtained during the present project (see Chapter 2), and according to these results, it showed that the $\mathrm{R}^{2}$ group ( $\mathrm{R}^{2}=\mathrm{H}<\mathrm{Me}<i \operatorname{Pr}$ ) had little effect upon the stereochemical outcome of $\alpha$-amino- $\beta$ hydroxy ester $\mathbf{1 6 5}$ formation (see Chapter 2).

Table 1.1

The iodocyclization of these precursors appeared to be much faster than those used in previous studies (Scheme 1.20$)^{20}$ and elimination to the pyrrole $\mathbf{1 6 8}$ could be achieved by treatment with methanesulfonyl chloride and pyridine in dichloromethane. Also, this report found that the use of idodine monobromide in dichloromethane tended to give better results to obtain the pyrroles 168 .

### 1.3.2 A A generally applicable method for pyrrole synthesis

The work in this section was carried out in collaboration with an Erasmus student, Heinz Rost from Clausthal University. ${ }^{35 b}$ We were keen to access alternative approaches to seemingly suitable precursors in order to extend this generality even further. Thus, until now, all examples contained a 2-carboxylate group. As this is one of the key constraints associated with some of the 'classical' approaches to pyrroles, the motivation for this section of the
project is clear. Though it seemed unlikely that the ester group was necessary for the cyclisation, it is also well worthwhile to confirm this.

Knowing that the more generalized substrates 169 were required, we therefore sought to access this model system from an $N$-tosyl ketone 170 and an acetylide 171 (Scheme 1.38). Amino-hydroxylation, involving symmetric starting materials such as trans-stilbene and 2butene, and followed by oxidation of the resulting alcohols was used to prepare the ketone 170 (Chapter 2).

Scheme 1.38

At the same time, we reasoned that symmetrical precursors 172 could be readily obtained by exposure of an $N$-tosyl- $\alpha$-amino ester $\mathbf{1 7 3}$ to two equivalents of an acetylide $\mathbf{1 7 1}$. If these precursors 169 and 172 could be cyclised successfully, this could lead to the pseudosymmetrical iodopyrroles 174 and 175 , respectively.

Rost ${ }^{35 \mathrm{c}}$ tested this methodology by preparing $\alpha$-amino ketone 170 and $\alpha$-amino esters $\mathbf{1 7 3}$ as starting materials, with a view to carrying a second alkyne function through the key cyclisation step (see Chapter 2). As detailed in Table 1.2 and Table 1.3, these underwent smooth cyclisation in acetonitrile to achieve excellent yields of the highly substituted iodopyrroles without the need for a subsequent elimination step.

| $\mathrm{R}^{1}, \mathrm{R}^{2}$ | 170 <br> $\%$ Yield | $\mathbf{1 6 9}$ <br> $\%$ Yield | $\mathbf{1 7 4}$ <br> $\%$ Yield |
| :---: | :---: | :---: | :---: |
| $\mathrm{Ph}, \mathrm{Ph}$ | 55 | 99 | 73 |
| $\mathrm{Ph},^{\mathrm{n}} \mathrm{Bu}$ | 55 | 96 | 83 |
| $\mathrm{Me},{ }^{\mathrm{n}} \mathrm{Bu}$ | 54 | 83 | 67 |

Table 1.2

Table 1.3

The $\alpha$-amino-alcohol 169 worked well in our standard iodocyclisation. Following on from this, Rost tested this methodology on $\alpha$-amino alcohols $\mathbf{1 7 2}$ under the same condition as $\alpha$ -
amino ketone 169 (Table 1.3). Again, the results were excellent, although generally the dihydropyrroles $\mathbf{1 7 6}$ were formed, so a further elimination step was required.

### 1.4 Silver-mediated cyclisation

According to Section 1.2.7, the transition metal-catalyzed cyclisation of disubstituted alkynes possessing a nucleophile in proximity to the triple bond by either copper or palladium reagents has been shown to be extremely effective for the synthesis of a wide variety of carbo- and heterocycles. ${ }^{17.18,36}$ In 1995, Marshall ${ }^{37}$ reported a clean and high yielding synthesis of furans by $\mathrm{Ag}(\mathrm{I})$-catalyzed cyclisation (Scheme 1.39).

Scheme 1.39

However, the reactions of propargyl ketones $\mathbf{1 7 9}$, failed with $\mathrm{Ag}(\mathrm{I})$ as catalyst. ${ }^{38}$ In 2000, Hashmi reported a new gold-catalyzed C-C bond formation in which the Au (III) catalyst readily transformed propargyl ketones 179 into furans 180 within minutes at room temperature in quantitative yields (Scheme 1.40). ${ }^{39}$

Scheme 1.40

Following on from Christopher Sharland's work, ${ }^{35 \mathrm{a}}$ the $\alpha$-amino- $\beta$-hydroxy ester 181 was dissolved in anhydrous diethyl ether and to this was added one equivalent of $10 \% \mathrm{wt} / \mathrm{wt}$ silver(I) nitrate on silica and the mixture was stirred vigorously, in the dark, at room temperature for 2 hours. After removal of the catalyst by filtration and evaporation of the ether, dihydropyrroles $\mathbf{1 8 2}$ were obtained in excellent yield (Table 1.4). ${ }^{35 a}$ The dihydropyrroles $\mathbf{1 8 2}$ were very sensitive to elimination, and dehydration was observed on standing in deuteriochloroform to give the corresponding pyrroles 183.

Table 1.4

We aimed to study the scope and limitations of the chemistry in iodocyclisation and silvermediated cyclisation, such as an influence of iodine-functionalised pyrrole with a various side chains and an application to different terminal alkynes.

### 1.5 Alternative syntheses of $\alpha$-amino alcohols

The development of syntheses providing high diastereoseletivity of $\alpha$-amino alcohols $\mathbf{1 8 4}$ has intrigued generations of chemists and been the subject of intense research. This effort has provided a diversity of methodologies, which have reviewed briefly here. Several strategically different approaches toward $\alpha$-amino alcohols 184 involving a carbon-carbon bond-forming event are conceivable (Scheme 1.41).

Scheme 1.41

### 1.5.1 Addition to $\alpha$-aminocarbonyls

An attractive solution (route $a$ ) consists of the addition of electrophiles to glycine enolate derivatives $186\left(\mathrm{R}^{1}=\mathrm{CO}_{2} \mathrm{Me}, \mathrm{R}^{3}=\mathrm{Ts}\right)$, which has been used successfully as a methodology to access the $\beta$-hydroxy- $\alpha$-amino ester 184 (see page 16). Another fast route (route $b$ ) to achieve $\alpha$-amino alcohols 184 rapidly is the addition of two nucleophiles, such as the acetylide 187 to electrophilic carbonyl group of $N$-tosyl- $\alpha$-amino ester 188 (see Section 1.3.2.4, page 24).

### 1.5.2 Asymmetric aminohydroxylation

Osmylation is an attractive method (route c) for the conversion of alkenes into $\alpha$-amino alcohols. Sharpless introduced what is now called the Sharpless asymmetric aminohydroxylation reaction. When cinnamate 194 was treated with nitrogen reagents in the presence of (DHQ) ${ }_{2}$ PHAL 195 using what provides facial selectivity (bottom ( $\alpha$ )-attack), optically pure amino alcohol 196 was formed. The nitrogen sources include TsNClNa , $\mathrm{MsNClNa}, \mathrm{CbzNClNa}$, and BocNClNa. In a typical example, cinnamate 194 was treated with $(\mathrm{DHQ})_{2} \mathrm{PHAL} 195,4 \% \mathrm{~K}_{2} \mathrm{OsO}_{2}(\mathrm{OH})_{4}$ and MsNClNa , in aqueous acetonitrile, and a $65 \%$ yield of $\mathbf{1 9 6}$ was obtained, in $94 \%$ ee (Scheme 1.42 ). ${ }^{40}$ Normally, the products are solid, and enantioselectivity can be increased by recrystallisation.

Scheme 1.42

Osmium tetroxide $\left(\mathrm{OsO}_{4}\right)$ had a relatively high reduction potential in acidic media and the primary use is for the conversion of alkenes to 1,2 -diols. Osmium tetroxide reacts with a nitrogen source to generate an osmium(VIII) complex 197, followed by addition of $\mathrm{L}^{*}$ (a ligand) to form a chiral osmate intermediate 198 (Scheme 1.43).

Scheme 1.43

Aminohydroxylation is proceeded by an allowed [2+2]-cycloaddition reaction with the alkene 199 to generate a complex 200 . The nitrogen atom is generally located in the position adjacent to the most electron-withdrawing group. Following reductive insertion of the Os-C bond into
an $\mathrm{Os}=\mathrm{O}$ bond, a rearrangement occurs to form a $[3+2]$-cyclo-complex 201, which is delivered to the same face as the nitrogen, to generate a complex 202. Reoxidation of the nitrogen source and dissociation of the ligand $L^{*}$ occurs, which is followed by hydrolysis to give the $\alpha$-amino acohol 203 and regenerate the complex 197. The reaction proceeds with high enantioselectivity but often with moderate yields due to poor regioselectivity and, when sulfonamide is used as the nitrogen source, the problem of removing the sulfonyl group has to be considered.

This was found however to be an attractive route to prepare the desired $\alpha$-amino alcohols 204, which were required as a precursor in our silver-mediated cyclisation (Section 1.4). We obtained $\alpha$-amino alcohol 206 in good yields as precursors of amino alcohols 204 (Scheme 1.44).

Scheme 1.44

### 1.5.3 Pinacol Coupling

The pinacol coupling reaction is a powerful method for forming from two carbonyl groups a doubly functionalized carbon-carbon bond. Most pinacol coupling reactions are believed to proceed through the radical-radical coupling of ketyl anions, which are formed upon treatment of the carbonyl compound with a reducing agent. In 1987, Pedersen ${ }^{41}$ developed new routes to functionalized amines employing transition-metal reagents (Scheme 1.45).

He suggested that the niobium-imine reagent 210 was behaving like an N,C-dianion that should react with carbonyl groups 211 (via coordination and insertion into the metal-carbonyl bond) to give amino alcohols 213 after hydrolysis (Scheme 1.46). However, the coupling between $\mathrm{PhCH}_{2} \mathrm{~N}=\mathrm{CHCMe}_{3} / \mathrm{NbCl}_{3}$ (DME) and octanal or between $t$-butyl methyl ketone and $\mathrm{PhCH}_{2} \mathrm{~N}=\mathrm{CHPh} / \mathrm{NbCl}_{3}$ (DME) was not observed.

Scheme 1.46

### 1.5.4 Addition of Nitronates (Henry reaction)

The nitroaldol reaction of nitronates with aldehydes or ketones is a versatile method of synthesizing $\alpha$-amino alcohols (route $d$ ). The nitronates are generated by catalytic amounts of base, such as sodium hydroxide, or by an equivalent amount of lithium diisopropylamide. The types of conditions, which are employed for the reaction, will largely depend on the type of functionality present, the solubility of the reactants and the ease to which the nitronate is generated.

Sandhoff and co-workers ${ }^{42}$ employed the dilithionitronate derivative of THP nitroethanol 215 in conjunction with 2-dodecanone 216 thereby providing the THP nitroalcohol 217 in low yield (38\%). Phase-transfer reduction of the THP nitroalcohol 217 followed by direct hydrolysis with acid furnished the aminodiol 218 (Scheme 1.47).

214
$n$ BuLi (2eq)/THF

218

Scheme 1.47

### 1.5.5 Nucleophile addition to imines

Cainelli ${ }^{43}$ has demonstrated the synthetic usefulness of $N$-metallo imines to synthesis amino alcohols. $\alpha$-Hydroxy- $N$-trimethylsilylimine $\mathbf{2 2 0}$ can be easily prepared from the corresponding aldehyde 219 via an addition-elimination reaction with lithium hexamethyldisilylamide (LiHMDS), to give clean conversion to the desired adduct 222 (Scheme 1.48). The diastereoselectivity is controlled by a chelation in the addition of the nucleophile to imines with a formation of the cyclic intermediate 221.

## Chapter 2

## Results and Discussion

### 2.1 Synthesis of $\alpha$-amino alcohols

### 2.1.1 Initial Studies

Following on from Larsen's successful work, ${ }^{28}$ we began with readily available phenyl acetylene 223 and reacted it with n-butyllithium in anhydrous tetrahydrofuran at $-40^{\circ} \mathrm{C}$ followed by the addition of two equivalents of dimethylformamide. Reverse work-up into a phosphate buffer gave 3-phenyl-2-propynal 224 in ca. 100\% crude yields (Table 2.1). From the infrared spectrum, the product showed the carbon-carbon triple bond at $2182 \mathrm{~cm}^{-1}$ and the carbonyl group at $1659 \mathrm{~cm}^{-1}$. This showed an excellent result with the facile method to achieve our precursors for alkynyl- $\beta$-hydroxy- $\alpha$-amino esters. We therefore applied this synthetic method to various alkynes.

Table 2.1

Commercially available 4-pentyn-1-ol and 5-hexyn-1-ol were protected with a TBDMS group (TBDMSCl, DMAP, imidazole, THF, 16 hours, r.t.) to give the corresponding silyl ethers 229 and 231 in relatively high yields of about $90 \%$. As shown in Table 2.1 , a range of $\alpha, \beta-$ acetylenic aldehydes were made in excellent yields without the need for further purification and were stored in the freezer until use.

Scheme 2.1

We prepared these precursors in quantity in order to test the aldol reaction with N -(4toluenesulfonyl) glycine methyl ester $\mathbf{1 5 4}$, which was easily synthesized from commercial glycine methyl ester and purified by recrystallisation to give a crystalline white solid. 3-Phenyl-2-propynal 224 was first reacted with the tin enolate 121, formed by deprotonation of the ester $\mathbf{1 5 4}$ by 2.5 equivalents of lithium diisopropylamine at $-78^{\circ} \mathrm{C}$ in the presence of 2.5 equivalents of tin(II) chloride. After work-up, the crude $\beta$-ynyl- $\beta$-hydroxy- $\alpha$-amino ester 160 was obtained as a yellow solid. From ${ }^{1} H$ NMR spectroscopic data, the ratio of diastereoisomers was showed to be approximately $90: 10$. The crude product was purified by column chromatography to give analytically pure $\beta$-hydroxy- $\alpha$-amino ester 160 in $76 \%$ yield (Scheme 2.1).

According to Sharland's report his results, taken together with those obtained during the present project, based on an X-ray crystal structure of a pure $\beta$-hydroxy- $\alpha$-amino ester showed it to be the anti-diastereoisomer. ${ }^{35 \mathrm{a}}$ We were therefore convinced that the same antidiastereoisomer was the major diastereomer.

In the ${ }^{1} \mathrm{H}$ NMR spectroscopic data of $\beta$-hydroxy- $\alpha$-amino ester 160, a characteristic resonance for the proton $\alpha$ to the ester group was positioned at 4.18 ppm as an apparent broad singlet and the $\beta$-proton at 4.82 ppm as a double doublet ( $J=10.2$ and 3.4 Hz ). This ester 160 was also confirmed by ${ }^{13} \mathrm{C}$ NMR ( $\alpha$ - and $\beta$-carbon at 53.5 and 61.0 ppm ), IR (broad absorbance at $3328 \mathrm{~cm}^{-1}$ ), low resolution MS ( $374[\mathrm{M}+\mathrm{H}]^{+}$), and high-resolution MS (391.1322 [M+NH4] ${ }^{+}$).

To complete the study, examples of aliphatic aldehydes were tested in this aldol reaction. Firstly, the 2-heptynal 226 was used to give pure $\beta$-hydroxy- $\alpha$-amino ester 161 in $64 \%$ yield and in a 96:4 ratio of diastereoisomers (Scheme 2.2). It was worth noting that the larger the scale of this aldol reaction, the more difficult the work-up. Due to large amounts of tin residues, these somehow absorbed the product; therefore the crude product required dividing into batches, which were filtered through a short plug of celite separately. Otherwise, it required approximately one hour for every 200 mL of crude solution to pass through the celite.

Scheme 2.2

The structure of the $\beta$-hydroxy- $\alpha$-amino ester 161 was confirmed by ${ }^{1} \mathrm{H}$ NMR (the proton $\alpha$ to the ester group at 4.06 ppm as a double doublet $[J=9.6$ and 3.6 Hz ], and the $\beta$-proton at 4.57 ppm as a double double triplet $[J=10.5,3.6$ and 1.8 Hz , also coupling with two protons of $\mathrm{CH}_{2} \mathrm{C} \equiv \mathrm{C}$ and a proton of hydroxy group]), ${ }^{13} \mathrm{C}$ NMR (carbon $\beta$ and $\alpha$ at 59.8 and 63.8 ppm), IR, low resolution MS ( $354[\mathrm{M}+\mathrm{H}]^{+}$) and CHN microanalysis.

### 2.1.2 Further studies

Followed on the previous condensations, it was decided to attempt the condensation with more complicated aliphatic aldehydes, such as silyloxy aldehydes 230 and 232, which have a potential competition by attack the iodine by $O$-functionalised side chains. Both were successfully used in this aldol reaction to form the $\beta$-hydroxy- $\alpha$-amino esters 163 and 164 in around $60 \%$ yields (Scheme 2.3). According to these slightly decreased yields, it was suggested that the tin enolate $\mathbf{1 2 1}$ was inadequately trapped with these silyloxy aldehydes. However, it still maintained good diastereoselectivity.
$\beta$-Hydroxy- $\alpha$-amino ester 163 showed consistent ${ }^{1} \mathrm{H}$ NMR data (the proton $\alpha$ to the ester group at 4.11-4.16 ppm as a multiplet, and the proton $\beta$ at 4.64 ppm as a double double triplet [ $J=10.0,3.7$ and 2.0 Hz , also coupling with two protons of $\mathrm{CH}_{2} \mathrm{C} \equiv \mathrm{C}$ and a proton of hydroxy
group]), ${ }^{13} \mathrm{C}$ NMR (carbon $\beta$ and $\alpha$ at 61.0 and 63.5 ppm ), IR, low resolution MS (470 $[\mathrm{M}+\mathrm{H}]^{+}$) and CHN microanalysis. From the ${ }^{1} \mathrm{H}$ NMR spectroscopic data, the ratio of diastereoisomers was shown to be approximately 92:8.

Scheme 2.3

The ${ }^{1} \mathrm{H}$ NMR spectroscopic data of $\beta$-hydroxy- $\alpha$-amino ester 164 showed the characteristic resonance for the proton $\alpha$ to the ester group at 4.13 ppm as a double doublet ( $J=9.5$ and 3.7 Hz , also coupling with a proton of NH ) and the proton $\beta$ at 5.51 ppm as a double doublet ( $J=$ 10.4 and 3.7 Hz , also coupling with a proton of hydroxy group). This ester 164 was also confirmed by ${ }^{13} \mathrm{C}$ NMR (carbon $\alpha$ and $\beta$ at 60.7 and 63.8 ppm ), IR (broad at 3488 and 3288 $\mathrm{cm}^{-1}$ ), low resolution MS ( $484[\mathrm{M}+\mathrm{H}]^{+}$) and CHN microanalysis. From the ${ }^{1} \mathrm{H}$ NMR spectroscopic data, the ratio of diastereoisomers was approximately 90:10.

Scheme 2.4

As we were interested in what effect a large substituent might have on the pyrrole synthesis, the aliphatic aldehyde 228 was also tested in this aldol reaction to form the $\beta$-hydroxy- $\alpha$ amino ester anti-162 (Scheme 2.4). Due to the bulky butyl group, complex 233 is more favorable than complex 234, and this yielded the expected product 162 as a $65 \%$ yield as a single diastereoisomer which was isolated as a white solid.

From the ${ }^{1} \mathrm{H}$ NMR spectroscopic data of $\beta$-hydroxy- $\alpha$-amino ester 162, the characteristic resonance for the proton $\alpha$ to the ester group appeared at 4.13 ppm as a double doublet ( $J=$ 9.6 and 3.9 Hz , also coupling with a proton of NH ) and the proton $\beta$ at 4.63 ppm as a double doublet ( $J=10.4$ and 3.9 Hz , also coupling with a proton of hydroxy group). The structure was also confirmed by ${ }^{13} \mathrm{C}$ NMR (carbon $\alpha$ and $\beta$ at 60.6 and 62.9 ppm ), IR (broad at 3267 $\mathrm{cm}^{-1}$ ), low resolution MS ( $\left.354[\mathrm{M}+\mathrm{H}]^{+}\right)$, CHN microanalysis and an X-ray crystal structure of two unitcells (Figure 2.1, full data on p. 235-242). Despite the previous X-ray determination by Sharland, we wished to be absolutely certain of the anti-stereochemical assignment.

Figure 2.1: X-Ray crystallographic Analysis
Methyl (2SR,3SR)-3-hydroxy-6,6-dimethyl-2-(4-methylphenylsulfonylamino)-hept-4ynoate 162

We have found that the glycine enolate 121 and $\alpha, \beta$-acetylenic aldehydes performed admirably in the desired aldol process, to provide the anti-products $\mathbf{1 6 0 - 1 6 4}$ as easily handled
solids; the results are shown in Table 2.2. ${ }^{34}$ Multiple crystallisation of the crude products were however required to remove a small amount of the $N$-tosylated methyl ester $\mathbf{1 5 4}$ to afford pure products.

Table 2.2 ${ }^{34}$

We wanted to also test whether a substrate containing an alternative oxygen-protecting group in the side chain would cyclise successfully, so a precursor was synthesized with a benzoyloxy-protecting compound 237. If the benzoyloxy aldehyde was prepared, it could then be used in the aldol reaction to form $\beta$-hydroxy- $\alpha$-amino esters 237 .

Since we obtained a good amount of the $\beta$-hydroxy- $\alpha$-amino ester 163 , the preparation of aldehyde 239 had been avoided. Thus, we decided to deprotect the silyl group on the $\beta$ -hydroxy- $\alpha$-amino esters $\mathbf{1 6 3}$ to form the amino esters $\mathbf{2 4 0}$ and use a benzoyl group to protect the primary hydroxy group to form the amino esters 237 (Scheme 2.10). This yielded $44 \%$ of the desired product 237 , and gave also over protection of the secondary hydroxy group to form the $\alpha$-amino ester 238 in $37 \%$ yield. The desired product was obtained in only $20 \%$ overall yield. However, the obtained quantities of the amino ester 237 were sufficient to test the iodocyclization (Scheme 2.32).

From the ${ }^{1} \mathrm{H}$ NMR spectroscopic data of the amino esters 240, 237 and 238, the ratio of diastereoisomers were approximately 80:20, which showed a little epimerization due to the basic fluoride when cleaved the silyl group to obtain the amino esters 240.

Scheme 2.10

### 2.1.3 Further studies of this aldol reaction

It should be noted that Sharland ${ }^{35 \mathrm{a}}$ has extended the use of this aldol reaction to the $\alpha, \beta$ unsaturated ketones or aldehydes 242 . These were performed in the same manner as the previous condensations. After work-up and purification by column chromatography, the $\beta$ -hydroxy- $\alpha$-amino esters $\mathbf{2 4 3}$ were obtained as a mixture of diastereoisomers (Table 2.3).

From the results, the condensation showed low diastereoselectivity when $R^{1}$ and $R^{3}$ become equal in size. During this present study, no further examples were done in this area, but it is noted that the products 243 could also be useful as pyrrole precursors. Williams's results ${ }^{35 \mathrm{~d}}$ showed similar diastereoisomer ratios of 248 and 249 with similar yields when these unsaturated aldehydes condensed with the $N$-tosylglycine methyl ester 154.

Table 2.3

### 2.2 Alternative synthesis of $\alpha$-amino alcohols

### 2.2.1 Addition to $\alpha$-Aminocarbonyls

In order to extend the scope of the iodocyclisation (see page 24), a rapid preparation of symmetrical precursor was observed. The N -tosyl-alanine methyl ester $\mathbf{2 5 0}$ was prepared from commercial alanine methyl ester, followed by adding to two equivalents of the acetylide 225, which was formed using $n$-buthyllithium at $-40^{\circ} \mathrm{C}$ for 30 min to give a desired symmetrical precursor $\mathbf{2 5 1}$ in $85 \%$ yield (Scheme 2.11). The ${ }^{1} \mathrm{H}$ NMR spectroscopic data showed a singlet of a hydroxy group at 2.27 ppm and a singlet of a methyl group $\left(\mathrm{Ts}-\mathrm{CH}_{3}\right)$ at 2.30 ppm .

From the ${ }^{1} H$ NMR spectroscopic data of the $\alpha$-amino alcohol 251, the characteristic resonance for the proton $\alpha$ to the NH group appeared at 3.35 ppm as a double quartet ( $J=9.1$ and 6.6 Hz , also coupling with a proton of NH ). The structure was also confirmed by ${ }^{13} \mathrm{C}$ NMR (carbon $\alpha$ to the NH group at 58.9 ppm ), IR (broad at 3465 and $3274 \mathrm{~cm}^{-1}$ ), low resolution MS (372 $\left.\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}\right)$and CHN microanalysis. This proved to be a facile route to
prepare the symmetrical precursors for the iodocyclisation. Rost also reported more examples on this synthetic route (see page 26).

## Scheme 2.11

### 2.2.2 Asymmetric Aminohydroxylation

We firstly approached the reaction with the chemical reagents that were available in our research laboratory. Condensed 2-butene 252 was treated with (DHQD) ${ }_{2} \mathrm{AQN}$ 253, 4\% $\mathrm{K}_{2} \mathrm{OsO}_{2}(\mathrm{OH})_{4}$ and TsNClNa (chloramine-T), in aqueous $t$-butanol, to give a $66 \%$ yield of amino alcohol 206 (Scheme 2.12).

Scheme 2.12

We faced difficulties in attempting to separate the product from the decomposition product of chloramine-T, tosylsulfonamide, $\mathrm{TsNH}_{2}$, and obtained this product as a mixture of the amino alcohol 206 and the sulfonamide in a ratio of $2: 1$. From ${ }^{1} \mathrm{H}$ NMR spectroscopic data clearly indicated a CHN proton at 3.07 as a sextet $(J=7.0 \mathrm{~Hz})$ and a CHO proton at 3.54 as a sextet ( $J=7.0$ ).

As the starting material was not pure, it was fortunate that the sulfonamide impurity did not affect the subsequent PCC oxidation and that the resulting ketone 205 could easily be separated from the impurity. After purification by flash chromatography, the ketone 205 was obtained as a white solid in $80 \%$ yield. The carbonyl group was observed in the ${ }^{13} \mathrm{C}$ NMR at 206.4 ppm and in the IR a strong absorbance at $1682 \mathrm{~cm}^{-1}$ was visible.

Scheme 2.13

To access examples of the desired $\alpha$-amino alcohols 204 (page 31), the ketone 205 was first treated with three equivalents of lithium acetylide-ethylenediamine 254 in anhydrous dimethyl sulfoxide at room temperature for 16 hours (Scheme 2.14).

Scheme 2.14

The amino alcohol $\mathbf{2 5 5}$ was isolated in $85 \%$ yield $(204, \mathrm{R}=\mathrm{H})$ and showed the ratio of 52:48 diastereoisomers according to two doublets due to the $\mathrm{CH}_{3}$ group at 0.95 and $0.98 \mathrm{ppm}(J=$ 6.7 Hz ) and two singlets due to $\mathrm{CH}_{3} \mathrm{C}(\mathrm{OH})$ at 1.35 and 1.37 ppm in the ${ }^{1} \mathrm{H}$ NMR spectrum data. The ketone was also treated with the acetylide 256 , which was formed by addition of $n$ buthyllithium at $-40^{\circ} \mathrm{C}$ (Scheme 2.15).

Scheme 2.15

It yielded only $34 \%$ of the amino alcohol $257\left(204, \mathrm{R}=\mathrm{SiMe}_{3}\right)$; this might be achieved by using more polar solvent. The ${ }^{1} \mathrm{H}$ NMR spectroscopic data showed a diastereisomer ratio of 61:39, corresponding to two doublets for $\mathrm{CH}_{3}$ at 0.90 and $0.94 \mathrm{ppm}(J=6.9 \mathrm{~Hz})$ and two singlets for $\mathrm{CH}_{3}$ at 1.25 and 1.26 ppm . This proved to be the desired protected acetylene 257.

To synthesise the $\alpha$-amino alcohols 259 (204, $\mathrm{R}=\mathrm{CH}_{2} \mathrm{OTBS}$ ), propynyloxysilane was prepared from commercially available propargyl alcohol, which was protected with a TBDMS group (TBDMSCl, DMAP, imidazole, THF, 16 hours, room temperature) to give the corresponding silyl ether $\mathbf{2 5 8}$ in excellent yields of about $99 \%$. This was treated with $n$-butyl lithium at $-40^{\circ} \mathrm{C}$, followed by the addition of the ketone 205 (Scheme 2.16).

## Scheme 2.16

In the ${ }^{1} H$ NMR spectroscopic data of the $\alpha$-amino alcohols $\mathbf{2 5 9}$, both diastereoisomers were identified in a anti:syn ratio of $55: 45$. The Felkin-Anh model has been used to suggest a major diastereoisomer (Scheme 1.17).

Scheme 1.17

The transition states are favoured when nucleophilic attack occurs from an orientation antiperiplanar to an adjacent $\sigma$-bond group. In this way, the transition state is staggered and the largest group is anti to the incoming nucleophile. Also, the most favoured transition conformation was considered to have the medium group position near the carbonyl oxygen.

Purification by column chromatography gave the amino alcohols $\mathbf{2 5 9}$ in $59 \%$ yield as a mixture of diastereomers (55:45) according to ${ }^{1} \mathrm{H}$ NMR spectroscopic data, corresponding to two doublets of $\mathrm{CH}_{3}$ at 0.93 and $0.98 \mathrm{ppm}(J=6.7 \mathrm{~Hz})$ and two singlets of $\mathrm{CH}_{3}$ at 1.31 and 1.33 ppm . This was also confirmed by ${ }^{13} \mathrm{C}$ NMR ( CHN at 58.5 ppm and $\mathrm{C}(\mathrm{OH})$ at 70.5 ppm ), IR, low resolution MS (412 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$and high resolution MS (412.1976 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

An undergraduate student, L. Dando had prepared an amino alcohol 261 in good yield, which was then available for our further use. Thus, the amino acohol 261 then treated with PCC in dichloromethane for 16 hours gave the corresponding ketone $\mathbf{2 6 0}$ in $80 \%$ yield (Scheme 2.18). Various precursors were prepared to test the silver-mediated cyclisation (Section 1.4), which were acetylenes with an unprotected acetylenic substituent 262, a saturated aliphatic substituent 263, and a protected-alcohol aliphatic substituent 264.

Scheme 2.18

The ketone $\mathbf{2 6 0}$ was first treated with three equivalents of lithium acetylide-ethylenediamine 254 in anhydrous dimethyl sulfoxide at room temperature for 16 hours to yield $67 \%$ of the amino alcohol 262. The amino alcohol 262 showed only one diastereisomer according to a singlet for $\mathrm{C} \equiv \mathrm{CH}$ at 2.54 ppm and a doublet of CHN at $4.51 \mathrm{ppm}(J=8.6 \mathrm{~Hz})$ in the ${ }^{1} \mathrm{H}$ NMR spectroscopic data.

The acetylene 225 was treated with $n$-butyl lithium at $-40^{\circ} \mathrm{C}$ and followed by the ketone $\mathbf{2 6 0}$. Purification by column chromatography gave the amino alcohols $\mathbf{2 6 3}$ in $58 \%$ yield with only one diasteromer by ${ }^{1} \mathrm{H}$ NMR analysis, corresponding to a triplet of $\mathrm{CH}_{3}$ at $0.84 \mathrm{ppm}(J=7.3$ $\mathrm{Hz})$ and a doublet of CHN at $4.43 \mathrm{ppm}(J=8.1 \mathrm{~Hz})$. This was also confirmed by ${ }^{13} \mathrm{C}$ NMR ( CHN at 67.4 ppm and HOC at 75.9 ppm ), IR, and low resolution MS ( $430[\mathrm{M}-\mathrm{OH}]^{+}$).

Finally, the acetylene 231 was treated with $n$-butyl lithium at $-40^{\circ} \mathrm{C}$ and followed by the ketone 260. Purification by column chromatography gave the amino alcohols 264 in only $25 \%$ yield with a mixture of diasteroisomers (4:1) by ${ }^{1} \mathrm{H}$ NMR spectroscopic data, corresponding to a doublet corresponding to the CHN at 4.45 ppm and $4.47 \mathrm{ppm}(J=8.2 \mathrm{~Hz})$ and a doublet corresponding to the NH at 5.42 ppm and $5.45 \mathrm{ppm}(J=8.2 \mathrm{~Hz})$.

According to Scheme 2.19, a chelated model of the ketone 265 would be likely to form an intermediate $\mathbf{2 6 5 A}$, which prefers to be trapped by the acetylene on a less hindrance and, if $\mathrm{R}^{1}$ is a phenyl group, the left-side, between $R^{1}$ groups, is very hindered. To support this suggestion, the summary of the results has showed in the Table 2.4.

Scheme 2.19

| Ketone, $\mathrm{R}^{1}$ | Amino alcohol, $\mathrm{R}^{2}$ | Yield\% | $\mathrm{CHN}(\mathrm{ppm}), J(\mathrm{~Hz})$ | Diastereoisomer <br> ratio |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{2 0 5}, \mathrm{CH}_{3}$ | $\mathbf{2 5 5}, \mathrm{H}$ | $\mathbf{8 5}$ | $3.19 \& 3.28,9.1 \& 6.7$ | $52: 48$ |
| $\mathbf{2 0 5}, \mathrm{CH}_{3}$ | $\mathbf{2 5 7}, \mathrm{SiMe}_{3}$ | 34 | 3.23, multiplet | $61: 39$ |
| $\mathbf{2 0 5}, \mathrm{CH}_{3}$ | $\mathbf{2 5 9}, \mathrm{CH}_{2} \mathrm{OTBS}$ | 59 | 3.22, multiplet | $55: 45$ |
| $\mathbf{2 6 0 , ~ P h ~}$ | $\mathbf{2 6 2}, \mathrm{H}$ | 67 | $4.51,8.6$ | $99: 1$ |
| $\mathbf{2 6 0}, \mathrm{Ph}$ | $\mathbf{2 6 3}, n \mathrm{Bu}$ | 58 | $4.43,8.1$ | $99: 1$ |
| $\mathbf{2 6 0}, \mathrm{Ph}$ | $\mathbf{2 6 4},\left(\mathrm{CH}_{2}\right)_{4} \mathrm{OTBS}$ | 25 | $4.45 \& 4.47,8.2$ | $80: 20$ |

Table 2.4

The diastereofacial selectivity is increased dramatically when the $\mathrm{R}^{1}$ is phenyl group. Also, when the $\mathrm{R}^{2}$ is more hindered, it would be more difficult to attack the ketone that causes decreasing yields. However, this methodology provided the desired protected acetylene precursors 266 in four steps with overall yields of 10-40\%.

### 2.3 Studies of Iodocyclization

### 2.3.1 Initial Studies

Having an idea to generalize and further develop by applying iodocyclization to $\alpha$-amino- $\beta$ hydroxy esters, firstly, we aimed to check Sharland's result ${ }^{35 \mathrm{a}}$ and tried to optimize the elimination process. Secondly, we aimed to extend to examples having functionality in the side chains, which could potentially interfere with the iodocycilzation. We chose to use toluene- $p$-sulfonamides to protect the amino groups, and in addition simple methyl esters rather than any more elaborate derivatives as these might interfere with the relatively favoured and desired 5-endo process.

A typical example of the key step is an iodine-induced 5-endo-dig cyclisation of the acetylenic $\alpha$-amino- $\beta$-hydroxy ester 161, which gave excellent yields of the 2 -hydroxy-2,3dihydropyrroles 267, together with iodopyrroles 268, by treatment with three equivalents of iodine and three equivalents of potassium carbonate in anhydrous acetonitrile at $0^{\circ} \mathrm{C}$, and then at room temperature for 16 hours. Dehydration occurred under either basic condition (1.1 equivalent of methanesulfonyl chloride and 1 equivalent of triethylamine in dichloromethane for 16 hr ) or acidic conditions ( 0.01 equivalent of pyridinium- $p$ toluenesulfonate in toluene for 16 hr ); good yields of the iodopyrroles 268 were isolated (Scheme 2.20).

Scheme 2.20

2-Hydroxy-2,3-dihydropyrrole 267 was not the expected product. According to Jones's work, ${ }^{22 b}$ the iodocyclization of related alkyne-1,2-diols 269 to $\beta$-iodofurans 271 with iodine and sodium hydrogen carbonate in acetonitrile, was successful achieved in good yield without ever observing the intermediate 3-hydroxy-2,3-dihydrofuran 270, despite attempts to do so (Scheme 2.21). Therefore, it was assumed that the iodocyclisation step was the slower, not unreasonably in view of the generation of an aromatic system in the second step.

Scheme 2.21

However, the ${ }^{1} \mathrm{H}$ NMR spectroscopic data of 5-n-butyl-3-hydroxy-4-iodo-2,3-dihydropyrrole 267 showed the characteristic resonances for a proton $\alpha$ to the ester group at 4.39 ppm and for a proton $\alpha$ to the alcohol at 4.68 ppm (Figure 2.2). These both appeared as doublets with a small coupling constant of 1.4 Hz . It was known that the predominant stereochemistry of the acetylenic $\alpha$-amino- $\beta$-hydroxy ester 161 was anti, which many explain the stability of the 5-n-butyl-3-hydroxy-4-iodo-2,3-dihydropyrrole 267.

Figure 2.2: ${ }^{1} \mathrm{H}$ NMR spectroscopic data of

## Methyl (2SR,3RS)-5-butyl-3-hydroxy-4-iodo-1-(4-methylphenylsulfonyl)-2,3-dihydro-pyrrole-2-carboxylate, 267.

The iodopyrrole 268 also appeared in this spectrum data, considering two main resonances of a proton $\beta$ to the NH group at 6.80 ppm and another one for $\mathrm{CH}_{3}$ at 3.73 ppm , in
approximately $5 \%$ along with the major product 267 , suggesting that the syn-ester 161 was converted directly to form the iodopyrrole 268 as in Jones's report. ${ }^{22 b}$

In the ${ }^{1} \mathrm{H}$ NMR spectroscopic data of the dihydropyrrole 267, diastereotopic hydrogens from two pairs of hydrogens $\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{a} \boldsymbol{H}_{b} \mathrm{CH}_{c} \boldsymbol{H}_{d}=n\right.$ - Bu ), were observed, presumably due to restricted rotation caused by the large iodine and sulfonyl substituents. The spectrum showed each proton separately at $1.39-1.44 \mathrm{ppm}, 1.50-1.53 \mathrm{ppm}, 2.41-2.46 \mathrm{ppm}$ and $2.64-2.68 \mathrm{ppm}$ as multiplets.

In the elimination process, it is important that the four atoms involved in the more facile $E_{2}$ elimination reaction lie in the same plane; the anti-periplanar configuration is preferred, as in syn-267. The anti-periplanar configuration is necessary for the orbital overlap, which must occur for the $\pi$ bond to be generated in the pyrrole 268 (route a). If this cannot be achieved, then the elimination will normally proceed by an $E_{/}$mechanism, which requires either loss of the hydroxy group to generate intermediate 272, which can then lose a proton to form the pyrrole 268 (route b), or the deprotonation of anti-161 to give the enolate 273, which can eliminate the hydroxy group to form the pyrrole $\mathbf{2 6 8}$ as shown (route c, Figure 2.3).

Figure 2.3: Elimination process.

Moreover, the acetylenic $\alpha$-amino- $\beta$-amino ester 161 was successfully and directly converted into the iododpyrrole 268, upon treatment with three equivalents of iodine monobromide and sodium hydrogen carbonate in acetronitrile at $0^{\circ} \mathrm{C}$ for 2 hours, followed by 14 hours at room temperature (Scheme 2.22). We achieved an excellent yield at this point, but not for all substrates, which will be discussed later on.

## Scheme 2.22

The full experimental method and data for the iodopyrrole 268 can be found in Chapter six. The ${ }^{13} \mathrm{C}$ NMR spectra (Figure 2.4) showed carbon-2 $(\mathrm{CHN})$ and $-3(\mathrm{CHOH})$ of the dihydropyrrole 267 at 70.1 and 80.6 ppm , and carbon-3 (CH) of the iodopyrrole 268 at 125.6 ppm . The latter spectra also demonstrates the effect of electronegative atom (I) on the carbon4 (CI) of the dihydropyrrole 267 , which resonates at 78.4 ppm and in the iodopyrrole $\mathbf{2 6 8}$, at 68.9 ppm , due to the heavy atom effect.

In both spectra, the carbons of all methyl groups and $\mathrm{CH}_{2} \mathrm{~S}$ in the butyl group appear in the region of $12.6-53.4 \mathrm{ppm}$; CHs in the tosyl group was clearly showed at 128.0 and 130.3 ppm for the dihydropyrrole 267 and 126.5 and 128.8 ppm for the iodopyrrole 268 ; three quaternary carbons of the dihydropyrrole 267 were showed at $134.5,149.8$ and 149.8 ppm , and four quaternary carbons of the iodopyrrole 268 were showed at $127.3,135.2,142.1$ and 144.3 ppm ; the carbonyl group of the dihydropyrrole 267 resonated at 169.8 ppm and in the iodopyrrole 268, at 159.4 ppm .

Figure 2.4: ${ }^{13} \mathrm{C}$ NMR spectroscopic data
a) Methyl (2SR,3RS)-5-butyl-3-hydroxy-4-iodo-1-(4-methylphenylsulfonyl)-2,3-dihydro-pyrrole-2-carboxylate, 267.

b) Methyl 5-butyl-4-iodo-1-(4-methylphenylsulfonyl)-pyrrole-2-carboxylate, 268.

Figure 2.6: ${ }^{13} \mathrm{C}$ NMR spectroscopic data

Methyl 4-(2-nitro-phenyl)-5-phenyl-1-(4-methylphenylsulfonyl)-1H-pyrrole-2carboxylate, 281.

To approach iodopyrrole $\mathbf{2 7 5}$, the cyclization of the acetylenic $\alpha$-amino- $\beta$-hydroxy ester $\mathbf{1 6 0}$ was carried out smoothly, using three equivalents of iodine and three equivalents of potassium carbonate in acetonitrile at $0^{\circ} \mathrm{C}$, then at room temperature for 16 hours to give the 2-hydroxy-2,3-dihydropyrrole 274 together with small amount of the iodopyrrole 275 in overall yield of $83 \%$.

Scheme 2.23

After elimination under basic conditions and isolation by column chromatography, the pyrrole 275 was obtained in $83 \%$ yield from $\alpha$-amino- $\beta$-hydroxy ester 160 (Scheme 2.23). The resonance in the ${ }^{13} \mathrm{C}$ NMR spectroscopic data was remarkable, again indicating a heavy atom effect of I at 71.8 ppm , and the ${ }^{1} \mathrm{H}$ NMR spectroscopic data also showed a sharp peak for the $3-\mathrm{H}$ proton in the pyrrole as a singlet at 6.92 ppm .

We were thus delighted to find that by simply exposing these $n$-butyl- and phenyl- substituted precursors to three equivalents of iodine and potassium carbonate in dry acetonitrile at $0^{\circ} \mathrm{C}$, led smoothly to an excellent crude yield of the intermediate hydroxy-dihydropyrroles. Subsequently, these crude intermediate dihydropyrroles underwent elimination upon treatment with methanesulfonyl chloride and triethylamine in dichloromethane at $0^{\circ} \mathrm{C}$, followed by stirring at room temperature for 16 hours. As our project aim was to develop the synthesis of highly substituted pyrroles, we carried out investigations for the possible applications of this new methodology, having confirmed the initial results reported by Sharland. ${ }^{35 \mathrm{a}}$

### 2.3.2 Suzuki coupling

Obviously, the availability of the iodopyrroles $\mathbf{2 6 8}$ and $\mathbf{2 7 5}$ offered the opportunity to also study methods for further homologation, especially using Pd-catalysed couplings. The Suzuki method was chosen for this, bearing in mind a particular target, Rhazinilam, the synthesis of which was planned for later in this present project.

The Suzuki cross coupling conditions seemed to offer a high yielding and convenient approach to various highly substituted pyrroles. In 1995, Chang reported the $\operatorname{Pd}(0)$-catalyzed cross coupling of the bromopyrrole 276 with phenylboronic acid to give 4-phenylpyrrole 277 as an optimum route to prepare this precursors for their studies on porphyrin synthesis (Scheme 2.24). ${ }^{44}$

Scheme 2.24

In 1999, Ghosez ${ }^{45}$ reported the palladium-catalysed coupling of 2-formyl-3-iodopyrrole 278 with various arylboronic acids as an easy and convergent access to 2 -substitued-3arylpyrroles 279 (Scheme 2.25).

## Scheme 2.25

This report had a very similar interest to our own project; therefore we decided to follow up on this coupling method in order to achieve our aim smoothly, the projected approach to (-)Rhazinilam.

For the Suzuki coupling, which generally has to be performed under basic conditions, hydroxide plays a crucial role in the catalytic cycle in the formation of the borate species $\mathrm{RB}(\mathrm{OH})_{3}{ }^{-}$, which occurs prior to the transmetallation step, and the cycle is completed by reductive elimination, to give the desired coupling product. The specific cycle for this coupling reaction is shown in Figure 2.5.

As the Suzuki coupling gives high yields of products (Scheme 2.25), this was applied to the iodopyrroles 268 and 275. The ortho-nitrophenylboronic acid was chosen, as the product could be useful in later plans for rhazinilam synthesis.

Figure 2.5

| Entry | R | \%PdCl ${ }_{2} \mathrm{dppf}$ | Base | time | \%yield |

Table 1.5: Coupling of 2-substituted-3-iodopyrrole with 0 -nitrophenylboronic acid.

Following on from Ghosez's report, ${ }^{45}$ the Suzuki reaction was first performed at $80^{\circ} \mathrm{C}$ in DMF- $\mathrm{H}_{2} \mathrm{O}(4: 1)$ with $10 \%$ of $\mathrm{PdCl}_{2} \mathrm{dppf}$ in the presence of $\mathrm{Ba}(\mathrm{OH})_{2} .8 \mathrm{H}_{2} \mathrm{O}$ over 5 minutes. The coupled product was obtained in only $10 \%$ yield (Table 1.5 , entry 1 ). It can be clearly indicated by ${ }^{13} \mathrm{C}$ NMR: the CI signal at 71.8 ppm of the iodopyrrole 275 disappears to reveal a complicated aryl-carbon region at 122.2-149.6 ppm of $o$-nitrophenyl-pyrrole 281 (Figure 2.6). The $o$-nitrophenyl-pyrrole 281 is also indicated by ${ }^{1} \mathrm{H}$ NMR (one proton of 3-H at 6.82 ppm as a singlet), IR , low resolution $\mathrm{MS}\left(445[\mathrm{M}+\mathrm{H}]^{+}\right)$, and CHN microanalysis.

It has been reported that the addition of base exerts a remarkable effect on the transmetalation rate of organoboron reagents. In fact, the addition of a strong base exerts a remarkable effect on the acceleration of the coupling rate for stericly hindered arylboronic acids, such as mesitylboronic acid. ${ }^{46}$

Herein, our coupling conditions preferred weaker bases, such $\mathrm{Na}_{2} \mathrm{CO}_{3}$, to give yields of 282, ranging from $58 \%$ to $69 \%$, for the coupling of 2-butyl-3-iodopyrrole 268 with onitrophenylboronic acid (Table1.5, entry 7). However, when $\mathrm{R}=\mathrm{Ph}$ as in 275, the choice of base seems to make no difference to the yield of the $o$-nitrophenyl-pyrrole $\mathbf{2 8 1}$ isolated.

The structure of the pyrroles (281 and 282) were confirmed by X-ray crystallographic analysis; the structure of $\mathbf{2 8 2}$ has the methyl ester disordered, as shown in Figure 2.7 (full data on p .243 for the pyrrole 281 and p. 249 for the pyrrole 282). We noted that the nitrophenyl ring at $\mathrm{C}(4)$ and the methylphenylsulfonyl group at $\mathrm{N}(1)$ were both found to lie on the different side of the pyrrole.

282

### 2.3.3 Further studies

We reasoned that this approach was ideal for the rapid preparation of (-)-Rhazinilam 283 and analogs (Chapter 3), if we could apply this methodology to our key models according to four rings of (-)-Rhazinilam 283. To test the generality of this methodology in preparing these simple precursors, we designed four different pyrroles 284, 285, 286, and 287 at the 5position varying in substitution (considered to piperidine ring, nine-membered lactam ring, hindered substitute, and application on coupling reaction, respectively, as shown in Figure 2.8).

283

285

286

Figure 2.8: Design of the key models to approach (-)-Rhazinilam 283

### 2.3.2.1 An attempt to establish models to piperidine and nine-membered lactam ring

The iodocyclization (Section 1.3.1) of the $\alpha$-amino- $\beta$-hydroxy esters $\mathbf{1 6 3}$ and $\mathbf{1 6 4}$ revealed a major concern in the synthesis, as these side chains contained an oxygen atom. According to Baldwin's rules, along with the 5 -endo-dig cyclization, it was possible that the $\alpha$-amino- $\beta$ hydroxy ester 164 might favor 6 -exo-dig or, especially, 5 -exo-dig cyclization (Scheme 2.26), and $\alpha$-amino- $\beta$-hydroxy ester 163 might favor 6 -endo-dig cyclization (Scheme 2.27). ${ }^{20}$

Scheme 2.26

Scheme 2.27

To test this concern, $\alpha$-amino- $\beta$-hydroxy ester 163 was prepared on a large scale and treated with three equivalents of iodine and three equivalents of potassium carbonate in acetonitrile at $0^{\circ} \mathrm{C}$, then at room temperature for 16 hours. It was pleasing to find that this worked well to give 3-hydroxy-4-iodo-dihydropyrrole 292 in $91 \%$ yield (Scheme 2.28) without any trace of other possible cyclizations.

The ${ }^{1} \mathrm{H}$ NMR spectroscopic data of 3-hydroxy-4-iodo-2,3-dihydropyrrole, 292 showed the characteristic resonance for the proton $\beta$ to the ester group at 4.38 ppm as a double doublet, ( $J=7.9$ and 1.5 Hz , also coupling with a proton of hydroxy group) and the proton $\alpha$ at 4.56 ppm as a doublet $(J=1.5 \mathrm{~Hz})$. The structure was also confirmed by ${ }^{13} \mathrm{C}$ NMR (CI at 78.2 ppm), IR, low resoluion MS ( $578\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}$), and high-resolution MS ( $\left.596.0997[\mathrm{M}+\mathrm{H}]^{+}\right)$.

Scheme 2.28

Dehydration was somewhat less successful under either basic conditions (1.1 equivalent of methanesulfonyl chloride and 1 equivalent of triethylamine in dichloromethane for 16 hr ), or acidic conditions ( 0.01 equivalent of pyridinium-p-toluenesulfonate in toluene for 16 hr ). There was a tiny amount of the expected pyrrole (a proton of the pyrrole at 6.80 ppm ), but the quantities were too small to isolate; instead, the alcohol protecting group had been removed to give iodopyrrole 293, which was isolated in low yield (Scheme 2.29).

Scheme 2.29

Some optimization studies were carried out briefly to gain the desired pyrrole 294; as a result, the dihydropyrrole 292 was refluxed in dichloromethane, followed by the addition of triethylamine and methanesulfonyl chloride. The reaction was observed to be complete within 5 minutes (Scheme 2.30) and gave the pyrrole 294 in $50 \%$ isolated yield.

Scheme 2.30

The homologous $\alpha$-amino- $\beta$-hydroxy ester 164 was also successfully converted into the iodopyrrole 284 using the same condition as the iodopyrrole 294, in $65 \%$ isolated yield (Scheme 2.31). Due to limited time, this reaction has not been optimized to achieve even better conversion to the iodopyrrole 294.

Scheme 2.31

During the optimization attempts to prepare the iodopyrrole 294, it was suggested to use a different protecting group for the hydroxy function. Subsequently, the benzoyl-protected $\alpha$ -amino- $\beta$-hydroxy ester 237 was prepared, and treated with three equivalents of iodine and three equivalents of potassium carbonate in acetonitrile at $0^{\circ} \mathrm{C}$, then at room temperature for 16 hours. The crude product was then treated with 1.1 equivalents of methanesulfonyl chloride and 1 equivalent of triethylamine in dichloromethane for 16 hr at room temperature, to give smoothly the iodopyrrole 295 in $66 \%$ overall isolated yield (Scheme 2.32).

## Scheme 2.32

### 2.3.2.2 Hindered substitution on the iodopyrrole

In order to apply this route to (-)-Rhazinilam 283, a challenge of this project is the smooth application of this methodology to pyrroles with very bulky substituents in the 5 -position, such as a tert-butyl group, which could be regarded as a model substrate. Therefore, $\alpha$ -amino- $\beta$-hydroxy ester $\mathbf{1 6 2}$ was prepared in a large amount and treated with three equivalents of iodine and three equivalents of either potassium carbonate or sodium hydrogen carbonate in acetonitrile or in dichloromethane at $0^{\circ} \mathrm{C}$, then at room temperature for 16 hours (Scheme 2.33). As expected, this model was hindered by the tert-butyl substituent to form 2,3-dihydro-3-hydroxy-4-iodopyrrole 296 and cyclizations were poor yielding.

Table 1.6: Iodocyclisation conditions of 5-tert-butyl-4-iodo-2,3-dihydropyrrole 156.
Note: ${ }^{\text {a }}$ Using $\mathrm{NaHCO}_{3}$ as base; ${ }^{\mathrm{b}}$ Using $\mathrm{NaHCO}_{3}$ as base and $20 \%$ tetrabutylammonium bromide, as a phase transfer catalyst; ${ }^{\text {c }}$ Recovery of the starting material 162.

After optimization, we found that it was essential, in order to obtain reasonable yields of intermediate dihydropyrrole 296, to use water in this iodocyclization. The use of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in both dry acetonitrile and dry dichloromethane gave no cyclisation product (Table 1.3; entry 1 and 2); therefore $\mathrm{NaHCO}_{3}$ was introduced into the study of this particular iodocyclisation. Attempts were made to drive the reaction by increasing the concentration of iodine, changing the temperature and solvent, but rather than the expected dihydropyrrole 296 being obtained, at a certain point, the starting material began to decompose. No improvement was obtained until biphasic conditions were applied and the dihydropyrrole 296 was first observed by ${ }^{1} \mathrm{H}$ NMR with resonances at 4.30 and 4.38 ppm for the two CHs (Table 1.6, entry 6, Figure 2.7).

According to an earlier study, iodine monobromide was successfully used to obtain iodopyrrole 268 ( $84 \%$ yield, Scheme 2.22) under conventional cyclisation conditions and without further elimination. However, this was not applicable to the preparation of the hindered dihydropyrrole 296 (Table 1.6, entry 3, 4 and 8).

Figure 2.7: ${ }^{1} \mathrm{H}$ NMR spectroscopic data

## Methyl (2SR,3RS)-5-tert-butyl-3-hydroxy-4-iodo-1-(toluene-4-sulfonyl)-2,3-dihydro-1H-

 pyrrole-2-carboxylate, 296.

With the advantage of the two-phase reaction (Table 1.6, entry 6-11), we suggested that the formation of cationic intermediate 298a and/or 298b in a two-phase environment was more favourable in a more polar solvent system (Scheme 2.34). We have no definite explanation, but suggest that syntheses of this type of molecule are possible using these more polar conditions. However, the longer reaction time and moderate yield gave us a concerned about using this route for our target compound, (-)-Rhazinilam 283.

Scheme 2.34

Although a range of dehydrations was attempted under various conditions, the desired pyrrole 297 was never obtained from dihydropyrrole 296 and the reason for this difficulty was unclear. The elimination step is dependent on conformation, as discussed earlier; the hydrogen must be anti to the leaving group or the reaction will not occur easily. This problem was solved for the dihydro-iodopyrrole 292 (see Section 2.3.3.1). X-Ray crystallographic analysis confirmed that only the syn-configuration of the hydrogen and alcohol was present and in addition, the hydrogen atom of the hydroxy group and an oxygen atom on the sulfonyl group were both found to lie on the same direction, suggesting that their interaction could have interfered with the desired iodopyrrole 297 (Figure 2.8, full data on p. 256-260).

Figure 2.8: X-ray crystallographic Analysis

## Methyl (2SR,3RS)-5-tert-butyl-3-hydroxy-4-iodo-1-(4-methylphenylsulfonyl)-2,3-dihydro-1H-pyrrole-2-carboxylate, 296.

296

Interestingly, dehydration of the intermediate dihydropyrrole 296 when carried out in toluene and in the presence of PPTS led to isolation of the de-iodopyrrole $\mathbf{2 9 9}$ (two CHs at 6.12 and 6.65 ppm as doublets with coupling constants of 3.6 and 3.6 Hz respectively). This structure was confirmed using IR, mass spectral, ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR data and high-resolution MS (336.1266 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$. However, the question of what was occurring still remained. Protonation of the nitrogen of the dihydropyrrole 296 could lead to cycloreversion, which would regenerate the acetylene 162. Subsequent, acid-catalysed cyclization, shown in Scheme 1.47, would produce the pyrrole 299. ${ }^{35 \mathrm{e}}$

Scheme 2.35

Although we could not prepare the desired iodopyrrole 297, as a model substrate, coupling 5-tert-butyl-3-hydroxy-4-iodo-2,3-dihydropyrrole 296 with $o$-nitrophenylboronic acid was also clearly of interest (scheme 2.36).

Scheme 2.36

To test this coupling, we decided to carry out a Suzuki reaction on 3-hydroxy-2,3dihydropyrrole 296 at $90^{\circ} \mathrm{C}$ in DMF- $\mathrm{H}_{2} \mathrm{O}$ (4:1) with $20 \% \mathrm{PdCl}_{2} \mathrm{dppf}$ in the presence of sodium carbonate over 3 hours. 2-tert-Butyl-3-o-nitrophenyl-dihydropyrrole $\mathbf{3 0 3}$ was isolated in only $15 \%$ yield (Figure 2.9); the ${ }^{1} \mathrm{H}$ NMR spectroscopic data showed the characteristic resonance for the proton- $\beta$ to the ester group at 4.53 ppm as a double doublet ( $J=11.8$ and 1.2 Hz , also coupling with a proton of hydroxy group) and the $\alpha$-proton at 4.23 ppm as a doublet ( $J=1.2 \mathrm{~Hz}$ ).

Figure 2.9: ${ }^{1} \mathrm{H}$ NMR spectroscopic data

## Methyl (2SR,3RS)-5-tert-butyl-3-hydroxy-4-(2-nitro-phenyl)-1-(4-

 methylphenylsulfonyl)-2,3-dihydro-pyrrole-2-carboxylate, 303.

303

ppor ${ }_{10}$

No other data could be obtained, because in the time taken to run ${ }^{13} \mathrm{C}$ and NOE spectra, dehydration occurred in $\mathrm{CDCl}_{3}$ as shown by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis; the resonances corresponding to two CHs at 4.23 and 4.53 ppm disappeared and were replaced by one proton of the pyrrole 304 at 6.54 ppm (Figure 2.10).

Figure 2.10: ${ }^{1} \mathrm{H}$ NMR spectroscopic data

## 5-tert-Butyl-4-(2-nitro-phenyl)-1-(4-methylphenylsulfonyl)-pyrrole-2-carboxylic acid methyl ester, 304.

304

As we had only a small amount of the $o$-nitrophenyl-pyrrole 304, we decided to obtain a crystal for X-ray crystallographic analysis, as this pleasing result appeared to be a solution to the problem.. Surprisingly, an unexpected rearrangement of the pyrrole 304 to pyrrole 305 (Scheme 2.37) was observed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$, (the CH proton shifted from 6.54 ppm to 9.19 ppm ) and was confirmed by a selected X-ray crystallographic analysis having the nitro group disordered (Figure 2.11) and repeated ${ }^{1} \mathrm{H}$ NMR spectroscopic data of the crystal. Using the desired iodopyrrole 297 might solve this problem; however, the problem of the elimination of the dihydropyrrole 296 to give the pyrrole 297 still remained.

Scheme 2.37

Figure 2.11: X-ray crystallographic Analysis
Methyl 4-tert-butyl-5-(2-nitro-phenyl)-1-(4-methylphenylsulfonyl)-pyrrole-2carboxylate, 305 .

305

We first suggested that proton at 9.19 ppm was more likely to be identifiable as NH . To understand this ${ }^{1} \mathrm{H}$ NMR spectroscopic data, we carried out an experiment to observe this proton at different temperature. As NH at higher temperature, the peak should be broader or shift position, but no change in the ${ }^{1} \mathrm{H}$ NMR spectroscopic data was observed, whether obtained at $25^{\circ} \mathrm{C}$ or $50^{\circ} \mathrm{C}$. This was not an NH peak, but one CH of the pyrrole 305 was confirmed by a selected X-ray crystallographic analysis (Figure 2.11, full data p. 261-267).

Unfortunately, an explanation of this rearrangement has not been studied. Also, it was not appropriate to apply this route to (-)-Rhazinilam 283 as we had expected, and better methodology was required.

### 2.4 A generally applicable method for pyrrole synthesis

Interestingly, the iodocyclisation had also been scaled up to $53-\mathrm{mmol}$ scales in this study (Scheme 2.38). The reaction was carried out smoothly with 3 equivalents each of iodine and potassium carbonate at $0^{\circ} \mathrm{C}$ for 2 hours and at room temperature over 12 hours. At work-up stage, adding aqueous sodium thiosulphate, we experienced an extreme increase in the temperature of the reaction mixture. It is therefore essential to cool down the reaction mixture before adding the sodium thiosulphate to destroy the excess iodine.

Scheme 2.38

### 2.4.1 Palladium-catalysed Coupling Reactions

Following on from the results above, the project investigated the possible applications of this new methodology to other palladium-mediated reactions. Generally, the palladium coupling cycle involves oxidative addition, followed by transmetalation, and the cycle is completed by reductive elimination. This study on further elaboration of the iodopyrroles, was not a main target of the research project; therefore, no optimization was carried out to achieve better yields. We synthesised the iodopyrroles 308, 310, and 311 using Stille, Heck, and Suzuki coupling reactions, respectively.

### 2.4.2 Stille Coupling Reaction

In 1995, Scott ${ }^{47}$ successfully prepared several 3-vinylpyrroles by treatment of 3-iodopyrroles with commercial vinyltributyltin 307 in the presence of bis-(triphenylphosphine)palladium(II) chloride as catalyst. The iodopyrrole 306 was applied to this reaction (Scheme 1.53) and gave only $10 \%$ yield of 3 -vinylpyrrole $\mathbf{3 0 8}$, This structure of which was confirmed by ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, IR, low-resolution MS (398 $[\mathrm{M}+\mathrm{H}]^{+}$), and High-resolution MS (398.2150 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

Scheme 2.38

### 2.4.3 Heck reaction

The aryl palladium complexes formed via oxidative coupling of aryl halides with palldium( 0 ) can undergo the Heck reaction with a suitable olefin. Aryl halides differ greatly in their reactivity, aryl iodides being the most reactive, followed by aryl bromide. In general, aryl chlorides are very unreactive in the Heck reaction. Conjugate addition is usually preferred when the alkene contains an electron-withdrawing group. Consequently, Reetz and coworkers ${ }^{48 \mathrm{a}}$ developed an efficient system for the Heck reaction of unreactive aryl halides. We now tested 3-iodopyrrole 306 under these simple reaction conditions ${ }^{48 \mathrm{~b}}$ to prepare the pyrrole 310 (Scheme 2.39), but only a low yield was obtained. This pyrrole 310 was confirmed by ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, IR, low resolution MS ( $456[\mathrm{M}+\mathrm{H}]^{+}$), and high-resolution MS (456.2204 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

Scheme 2.39

### 2.4.4 Suzuki Reaction

Coupling of 3-iodopyrrole 306 with o-nitrophenylboronic acid is of real interest in this project. To test this coupling reaction, the iodopyrrole was treated with the boronic acid in DMF- $\mathrm{H}_{2} \mathrm{O}$ (4:1) in the presence of sodium hydrogen carbonate and $20 \% \mathrm{PdCl}_{2} \mathrm{dppf}$ at $80^{\circ} \mathrm{C}$
over 2 hours (Scheme 2.40). We successfully obtained the $o$-nitrophenyl-pyrrole 311 in $61 \%$ isolated yield, but this showed low stability at room temperature and was therefore only confirmed by ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, IR, and low resolution MS (493 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

Scheme 2.40

### 2.5 Silver-mediated cyclisation

According to Section 1.4, having a range of substrates available, we have tested this alternative methodology for inducing 5-endo-dig cyclisation of amino-alkynes to pyrroles. Following Sharland's report (see page 28), we extended this generality even further.

As a starting point, we subjected the $\beta$-alkynyl tosylamide 312, which was available within our research group, to $\mathrm{AgNO}_{3} /$ silica gel in dichloromethane in the absence of light (Scheme 2.41). No cyclisation was observed. According to related work, it seems to be essential to also have a hydroxy group at the $\beta$-position of the nucleophilic nitrogen to successfully form an intermediate in order to achieve the cyclisation, (Scheme 1.17).

Scheme 2.41

Despite this failure, we carried on with the idea and exposed a range of $\gamma$-alkynyl- $\beta$-hydroxy tosylamides 314, which were prepared in good yield (see Section 2.2, page 42), to 0.5 equivalent of $10 \% \mathrm{AgNO}_{3}$ on silica gel in dichloromethane at room temperature in the absence of light. We were delighted to find that from pure starting materials 314, after work-
up simply by filtration through a short plug of silica gel, the pyrroles 315 were obtained cleanly in excellent yields (Table 1.7).

314: $\mathrm{R}^{1}, \mathrm{R}^{2}, \mathrm{R}^{3}$
*Crude yield (reaction mixture was worked-up by filtration through short plug of silica gel).

Table 1.7: $\mathrm{Ag}(\mathrm{I})$-catalysed cyclisation of $\gamma$-alkynyl- $\beta$-hydroxy tosylated amine, $\mathbf{3 1 4}$.

Firstly, the $\gamma$-alkynyl- $\beta$-hydroxy tosylsulfonamide 255 was dissolved in anhydrous dichloromethane and to this was added 0.5 equivalent of $10 \% \mathrm{wt} / \mathrm{wt}$ silver(I) nitrate on silica and the mixture was stirred vigorously, in the dark, at room temperature for 4 hours (Scheme 2.42). After removal of the catalyst by filtration and evaporation of the ether, 2,3dimethylpyrroles 316 were obtained in good yield. The ${ }^{1}$ H NMR spectroscopic data of the
pyrrole 316 showed the characteristic resonance for the 4 -and 5-proton at 5.99 and 7.13 ppm respectively as a pair of doublets $(J=3.3 \mathrm{~Hz})$. This was also confirmed by ${ }^{13} \mathrm{C}$ NMR $(\mathrm{CH}$ at 113.9 and 120.6 ppm$)$, IR, and low resolution MS $\left(250[\mathrm{M}+\mathrm{H}]^{+}\right)$.

## Scheme 2.42

The mechanism of this cyclisation is still unknown. We attempted to observe the cyclisation of $\gamma$-alkynyl- $\beta$-hydroxy tosylsulfonamide 257. The ${ }^{1} \mathrm{H}$ NMR spectroscopic data (Figure 2.12) of the tosylsulfonamide 257, showed both methyl groups at 0.90 and 1.26 ppm and the resonance due to CH can be seen at 3.10 ppm . It noted that small amount of impurity at 2.64 ppm was also observed.

Figure 2.12: ${ }^{1} \mathrm{H}$ NMR spectroscopic data

## N-(2-Hydroxy-1,2-dimethyl-4-trimethylsilanyl-but-3-ynyl)-4-methylphenylsulfonamide,

 257

257

As shown in Figure 2.13, after 4 hours, some of the tosylamide $\mathbf{2 5 7}$ had cyclised. Two methyl groups as single peaks at 1.83 and 2.11 ppm , and the occurrence of two CHs of the pyrrole as doublets ( $J=3.3 \mathrm{~Hz}$ ) at 5.91 and 7.06 ppm (similar to the pyrrole 316, Scheme 2.42 ) was observed. By comparing the integrations to one proton of NH at 4.66-4.80 ppm, the ${ }^{1} \mathrm{H}$ NMR spectroscopic data showed that the three methyl groups did not integrate for nine protons. This suggests that deprotection of the silyl group on the terminal acetylene occurred prior to cyclisation since the tosylamide 255 was observed in the ${ }^{1} \mathrm{H}$ NMR, showing the terminal acetylene at 1.94 ppm (Scheme 2.43). An additional 12 hours of this cyclisation gave overall 72\% yield of pyrrole 316 from 257.

Figure 2.13: ${ }^{1} \mathrm{H}$ NMR spectroscopic data
Four-hour cyclisation of N-(2-Hydroxy-1,2-dimethyl-4-trimethylsilanyl-but-3-ynyl)-4methylphenylsulfonamide, 257 (Scheme 2.43)

Scheme 2.43

Interestingly, the formation of pyrrole $\mathbf{3 1 7}$ from the two diastereoisomers of tosylamides 259, in a anti:syn ratio of 55:45, presumably the cyclisation of syn-259, occurred faster. According to transition conformation of dihydropyrrole 322 , it was predicted that the reacting conformation of the syn-isomer was more favourable, with the two methyl groups 'equatorial' to minimise both torsional and steric strain. $E_{2}$ elimination was set up to obtain the pyrrole 317 (Scheme 2.44).

Scheme 2.44

Indeed, the ${ }^{1} \mathrm{H}$ NMR spectroscopic data of the eight-hour cyclisation of tosylamide 259, showed that the majority of the minor isomer of the precursor (syn-259) was cyclised faster by losing two $\mathrm{CH}_{3} \mathrm{~S}$ at 0.98 and 1.33 ppm rapidly (Figure 2.14). The pyrrole $\mathbf{3 1 7}$ was also observed, by the appearance at two new $\mathrm{CH}_{3} \mathrm{~s}$ at 1.79 , and 2.08 ppm and one CH at 5.98 ppm as a singlet. Also, a multiplet of CH in the tosylamide 259 at 3.18 -3.22 ppm was disappearing, the $\mathrm{OCH}_{2}$ of the pyrrole 317 at 4.79 ppm was appearing, and dichloromethane at 5.21 ppm was only a trace of solvent in use. After a further twelve-hour cyclisation, the reaction was complete according to the ${ }^{1} \mathrm{H}$ NMR of pyrrole $\mathbf{3 1 7}$ (Figure 2.15). This was also confirmed by ${ }^{13} \mathrm{C}$ NMR (4-CH at 113.6 ppm ), IR, and low resolution MS ( $392[\mathrm{M}+\mathrm{H}]^{+}$and 262 [M-TMS $^{+}$).

Figure 2.14: ${ }^{1} \mathrm{H}$ NMR spectroscopic data
Eight-hour cyclisation of $\mathbf{N}$-[5-(tert-Butyl-dimethyl-silanyloxy)-2-hydroxy-1,2-dimethyl-pent-3-ynyl]-4-methylphenylsulfonamide, 259

Figure 2.15: ${ }^{1} \mathrm{H}$ NMR spectroscopic data
5-(tert-Butyldimethylsilanyloxymethyl)-2,3-dimethyl-1-(4-methylphenylsulfonyl)pyrrole

As shown by the results in Table 1.7, the more substituted or hindered the precursor is, the longer reaction time is required for complete cyclisation. The tosylamides 262 and 263 were cyclized successfully within 16 hours to give the pyrroles 318 and 319 , respectively, in excellent yield ( $>99 \%$ ). Interestingly, the tosylamide 264 was treated with $10 \% \mathrm{wt} / \mathrm{wt} \mathrm{AgNO}_{3}$ on silica in dichloromethane in the dark for 4 hours, and the dihydropyrrole 323 was observed in the ${ }^{1} \mathrm{H}$ NMR spectrum as the OH and CH appeared at 4.81 and 4.92 ppm as singlets (Figure 2.16). No precursor was evident. Diastereotopic hydrogens ( $\mathrm{TBSOCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{\boldsymbol{a}} \boldsymbol{H}_{\boldsymbol{b}}$ ) were showed each proton separately at 2.54-2.62 ppm and 2.792.87 ppm as multiplets.

Figure 2.16: ${ }^{1} \mathrm{H}$ NMR spectroscopic data
Four-hour cyclisation of $\mathbf{N}$-[8-(tert-butyl-dimethyl-silanyloxy)-2-hydroxy-1,2-diphenyl-oct-3-ynyl]-4-methylphenylsulfonamide, 264.

The cyclisation was completed within a 4-hour period, but it required more reaction time for the elimination process to obtain the desired pyrrole $\mathbf{3 2 0}$. We decided to carry on the reaction further in $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel using the same reaction condition. After a further 12 hours, the expected pyrrole $\mathbf{3 2 0}$ (Figure 2.17) was obtained, in $58 \%$ yield, observing one CH of the pyrrole at 6.22 ppm . The moderate yield suggested the loss of the large TBDMS protecting group after cyclisation (Scheme 2.45). Due to filtration through a
plug of silica gel in the standard work-up, this has not been confirmed by the crude mixture ${ }^{1} \mathrm{H}$ NMR spectroscopic data.

Figure 2.17: ${ }^{1} \mathrm{H}$ NMR spectroscopic data
5-[4-(tert-Butyldimethylsilanyloxy)-butyl]-2,3-diphenyl-1-(4-methylphenylsulfonyl)pyrrole 320

Scheme 2.45

The cyclization of tosylamide 251 was completed within a 4-hour period to obtain the pyrrole 321 in quantitative yield ( $>99 \%$, Scheme 2.46).

Scheme 2.46

### 2.6 Conclusion

The tin-mediated aldol addition of $N$-tosyl glycine to related $\alpha-\beta$-unsaturated aldehydes and ketones was successfully achieved. However, a range of alternative methodologies showed the possibilities of different approaches to a variety of $\alpha$-amino alcohols. To determine the better route, the ease of precursor preparation should be taken into consideration.

Such 'practical' syntheses are known for several important heterocycles. They are usually limited to certain substitution patterns in the target molecules. Also, yields seldom exceed $60 \%$. Several side products are observed because several intermediates may react in different ways. We have been very successful in developing a novel synthesis of iodopyrroles via 5-endo-dig cyclisations of acetylenic tosylamides. These reactions require mild conditions, using a relatively simple two-step strategy to acquire the desired starting materials (see Section 2.1). Moreover, it is possible for the iodopyrroles to undergo subsequent palladiumcatalysed couplings. For further work, it is suggested the use of thallium(I) ethoxide to promote Suzuki cross coupling reactions could be beneficial. ${ }^{49}$ In addition, we have developed a synthesis of 2,3-disubstituted pyrroles and 2,3,5-trisubstituted pyrroles by silvermediated cyclisations of similar acetylenic tosylamides. This required very mild conditions and gave pyrroles cleanly and in excellent yields (usually close to 100\%). Further, the silver(I) was used catalytically. The possibilities of catalyst re-use and scale-up using either batch or flow technique remain to be assessed but appear to have considerable potential.

## Chapter 3

## (-)-Rhazinilam

### 3.1 Introduction

(-)-Rhazinilam 283 was first isolated in 1965 from Melodinus Australia, ${ }^{50}$ then again in 1970 from Rhazya stricta (Apocynaceae) by A. Chatterjee, ${ }^{51}$ who found it to contain an amide function and ethyl group. The structure of Rhazinilam 324 was firstly established in 1972. ${ }^{52,53}$ Its structure strongly suggested a derivation from a relative simple alkaloid, 5,21dihydrorhazinilam 325 as the natural precursor. ${ }^{52}$ Most recently (1987), ${ }^{54}$ (-)-Rhazinilam 283 was isolated from the Malaysian plant, Kopsia singapurensis (Ridley).

(-)-Rhazinilam, 283

326

Rhazinilam, 324

325

328

Figure 3.1

Smith and co-workers ${ }^{52}$ found that the electronic absorption and fluorescence spectra of rhazinilam 324 were very closely similar to those of $3 \mathrm{H}-3,4$-dimethylpyrrolo( 2,3 -c)quinoline $326\left(R, R^{\prime}=M e\right)$, also the ${ }^{1} H$ NMR spectrum showed six aromatic protons. The weak electronic absorption showed steric inhibition of conjugation of all three chromophores (amide, benzene, and pyrrole). It then became evident that rhazinilam $\mathbf{3 2 4}$ must posses partstructure $\mathbf{3 2 7}$ in which the amide group was part of a medium-sized ring.

The ${ }^{1} \mathrm{H}$ NMR spectrum of rhazinilam 324 showed only one methyl group, and the most intense peak in the mass spectrum was $\mathrm{M}-\mathrm{C}_{2} \mathrm{H}_{5}$, which suggested stabilization involving the
pyrrolic nitrogen (Figure 3.2). Therefore, the partial structure for rhazinilam 324 could then be extended to $328(\mathrm{~m}+\mathrm{n}=5)$.

Figure 3.2

To disconnect the amide bond, treatment of rhazinilam 324 with acetic acid yielded an amino acid, converted into a carboxylic acid. According to the base peak in the mass spectrum of which corresponds to $\mathrm{M}-\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{H}$, this was only compatible with attachment of the propionyl residue to the same quaternary atom as the ethyl group. The assignment of structure 324 to rhazinilam was then possible.

At the same time, Abraham and Rosenstein ${ }^{53}$ reported the structure of rhazinilam 324 by single crystal X-ray diffraction studies. Structurally, rhazinilam 324 is characterized by four rings: the phenyl A-ring, the nine-membered lactam B -ring, the pyrrole C -ring, and the piperidine D-ring. Although the absolute configuration of their enantiomer was not determined in this X-ray structural analysis, the A-C dihedral angle of (-)-rhazinilam 283 was $95^{\circ}$ and the amide bond seemed to possess a cis-conformation.

### 3.2 Biological activity ${ }^{55}$

### 3.2.1 Antimitotic agent

Antimitotic agents are active against solid tumors. In order to predict clinical responses, it is important to clarify the factors responsible for the antitumor effects of these agents. Antimitotic agents bind to tubulin and inhibit cancer cell proliferation. Two well-known examples of antimitotic agents are Vinblastine, which inhibits the polymerization of tubulin and Taxol, which inhibits the depolymerization of tubulin.

Using the tubulin test to screen antimitotic activities of plant extracts, the biological activity of rhazinilam has been demonstrated as responsible for the antitubulin activity of a Malaysian plant, Kopsia singapurensis. (-)-Rhazinilam 283 is an antimitotic agent, which mimics the
action of both Vinblastine and Taxol. Indeed, Taxol is the most promising antitumor agent developed in the past three decades.

### 3.2.2 Taxol

In the early 1960s, the National Cancer Institute (NCI) in the United States initiated a programme of biological screening of extracts taken from a wide variety of natural sources. One of these extracts was found to exhibit marked antitumour activity against a broad range of rodent tumours. Although this discovery was made in 1962, it was not until five years later that two researchers, Wall and Wani, of the Research Triangle Institute, North Carolina, isolated the active compound, from the bark of the Pacific yew tree (Taxus brevifolia). In 1971, Wall and Wani ${ }^{55 \mathrm{ab}}$ published the structure of this promising new anti-cancer lead compound, a complex poly-oxygenated diterpene.

Despite its well-documented biological activity, very little interest was shown in taxol until scientists at the Albert Einstein Medical College ${ }^{55 \mathrm{c}}$ reported that its mode of action was totally unique. Until this finding in 1980, it was believed that the cytotoxic properties of taxol were due to its ability to destabilise microtubules, which are important structures involved in cell division (mitosis). In fact, taxol was found to induce the assembly of tubulin into microtubules, and more importantly, that the drug actually stabilizes them to the extent that mitosis is disrupted. Such a novel mode of action was believed to make taxol a prototype for a new class of anticancer drugs.

Renewed interest in taxol led to major problems, since many groups wished to conduct clinical trials, and so large quantities of this material were required. The natural source, the Pacific yew tree, is an environmentally protected species, which is also one of the slowest growing trees in the world. Isolation of the compound, which is contained in the bark, involves killing the tree, and the quantities available by this method are pitifully small. It would take six 100-year old trees to provide enough taxol to treat just one patient.

In 1994, taxol was approved for the treatment of breast cancer, one of the newer chemotherapy drugs, following surgery and radical techniques of radiotherapy. The cost of producing sufficient quantities of this new wonder drug, however, is a severely limiting factor. Synthetic organic chemistry may provide a solution to this problem in the years to come.

### 3.3 Synthesis

### 3.3.1 An Overview

Rhazinilam 324 had been the subject of two successful total synthetic studies reported by Smith and co-workers in 1973. ${ }^{56}$ They used 3-(o-nitrophenyl)-pyrrole 329 as a key intermediate to establish the subsequent structure elements (Figure 3.3). To develop new practical routes towards heterobiaryls, this generated interests in building 3-arylpyrrole framework via a Suzuki coupling, such as in the reports of Ghosez in 1999, ${ }^{57}$ and Guerritte in $2000 .{ }^{58, b}$ According to Guerritte's studies, his intent was to have a rapid and efficient construction of a library of analogues for biological screening proposes.

324

Figure 3.3

Guenard and Guerritte ${ }^{59 a, b, c}$ had reported the syntheses of rhazinilam analogues during 19982001, and M. Banwell ${ }^{60}$ reported a convergent synthesis of ( $\pm$ )-B-norrhazinilam in 2000, which has been characterized and subjected to a preliminary biological evaluation. Finally in 2000, Johnson and Sames ${ }^{61}$ had achieved the total synthesis of (-)-rhazinilam 283 through C$H$ bond activation of hydrocarbon segments.

### 3.3.2 First Total Synthesis of Rhazinilam $324{ }^{56}$

Smith and co-workers ${ }^{56}$ had reported a partial synthesis of ( - )-Rhazinilam 283 from (+)-1,2didehydroaspidospermidine 330, and a total synthesis of rhazinilam 324 in 1973. After (+)-1,2-didehydroaspidospermidine 330 was oxidised by $m$-chloroperbenzoic acid, 5,21dihydrorhazinilam 332 then treated with aqueous iron(II) sulphate to give a moderate yield of (-)-Rhazinilam 283 (30\%, Scheme 3.1). However, the reactions were not always reproducible and poor yields were obtained due to work up difficulties.

Scheme 3.1

To have the entire carbon skeleton in their total synthesis involved the direct alkylation of 2-methoxycarbonyl-4-2-nitrophenyl pyrrole 333 by 4-ethyl-4-hydroxy-7-tosyloxyheptanoic acid $\gamma$-lactone $\mathbf{3 3 4}$ to give the pyrrole heptanoic acid $\gamma$-lactone 335, in $90 \%$ yield (Scheme 3.2).

334
$\xrightarrow[95 \%]{\mathrm{DCC} / \mathrm{THF}}$

$\left.\begin{array}{ll}\mathrm{R}=\mathrm{CO}_{2} \mathrm{CH}_{3} & 338 \\ \mathrm{R}=\mathrm{CO}_{2} \mathrm{H} & 339 \\ \mathrm{R}=\mathrm{H} & 324\end{array}\right] \mathrm{MeOH} / \mathrm{NaOH}, 50^{\circ} \mathrm{C}$

Scheme 3.2

To obtain the piperidine D-ring, the lactone 335 was treated with anhydrous aluminium chloride in nitromethane to give the tetrahydroindolizinyl propanoic acid 336 in $50 \%$ yield. The synthesis was then completed in four steps: reduction of the nitro group ( $86 \%$ yield), lactamisation by using DCC ( $>95 \%$ yield), saponification of the ester function and decarboxylation (88\% yield from 5-methoxycabonylrhazinilam 338).

However, this route probably could not be used to obtain pure enantiomers. The stereogenic center at the $\gamma$-lactone position would be destroyed during cyclisation onto the pyrrole to obtain 336. Perhaps a chiral Lewis acid could be used in place of aluminium trichloride in order to control the stereogenic center.

Their starting point for the synthesis of the lactone 334 was the interaction of diethyl 4ketopimelate 340 and ethylmagnesium bromide (Scheme 3.3).

## Scheme 3.3

After hydrolysis, the corresponding acid $\mathbf{3 4 2}$ was obtained $40 \%$ yield. The acid was reduced by the Rosenmund method, followed by sodium-borohydride to obtain the alcohol 344 with $70 \%$ yield. Tosyl choride in pyridine at $25^{\circ} \mathrm{C}$ converted this alcohol into the tosylate 334 .

Synthesis of the pyrrole 333 started with the ring synthesis of 3-(o-nitrophenyl)-pyrrole 347, which was then formylated by the Vilsmeier method to give 2-formyl-4-(o-nitrophenyl)pyrrole 348 ( $60 \%$ yield). The pyrrole 348 was then treated with silver oxide to give the pyrrole acid 349 and followed by diazomethane to give the pyrrole 329 with $82 \%$ yield (Scheme 3.4). This therefore gave an overall yield of Rhazinilam 324 of $>20 \%$.

Scheme 3.4

### 3.3.3 Total Synthesis of (-)-Rhazinilam 283 using C-H bond activation ${ }^{61}$

C - $\mathrm{H} \sigma$-bond activation of alkane and aromatic compounds is of considerable interest in recent organometallic chemistry, because this can introduce several functional groups into alkane and aromatic compounds through the $\sigma$-bond activation. Johnson and Sames ${ }^{61}$ had reported a directed C-H activation to obtain the pyrrole 351 in $60 \%$ yield, which was influenced by the proximity of the amino group to the ethyl groups in the diethyl intermediate $\mathbf{3 5 0}$ (Scheme 3.5).

7) NaOH (aq), MeOH then $\mathrm{HCl}(\mathrm{aq})$ $77 \%$

rhazinilam 283

Dehydrogenation of the ethyl group, mediated by a platinum complex, was accomplished in the presence of a variety of functional groups including the ester group, pyrrole and arene rings. To complete the total synthesis of rhazinilam 324, a one-carbon extension of the vinyl group and the subsequent macrocycle closure was required. The alkene double bond of $\mathbf{3 5 1}$ was transformed to an aldehyde, followed by Wittig reaction, catalytic hydrogenation, $t$-butyl ester and Boc deprotection, and finally a macrolactam formation with $>30 \%$ yield from 351 .

To obtain the intermediate $\mathbf{3 5 0}$, iminium salt $\mathbf{3 5 4}$ was generated from readily available imine 352 and $o$-nitrocinnamyl bromide 353 , followed by cyclisation and aromatization by heating the salt $\mathbf{3 5 4}$ in the presence of silver carbonate to give the pyrrole $\mathbf{3 5 5}$ in $70 \%$ yield. The carboxylate group was then installedto stabilize the electrophile-sensitive pyrrole ring, and finally the nitro group was reduced to furnish amine $\mathbf{3 5 0}$ in $88 \%$ yield (Scheme 3.6). This gave an overall yield of Rhazinilam $324>10 \%$.

Scheme 3.6

### 3.3.4 The synthesis of new substituted biphenyl analogs ${ }^{59 a, b, c}$

Guenard and Guerritte's studies ${ }^{59 \mathrm{ab,b} \mathrm{c}}$ had focused on the replacement of the phenylpyrrole by a biphenyl unit, and a range of candidates for structure-activity relationship studies were prepared. According to Guenard's previous studies, ${ }^{62}$ the presence of the aromatic units as well as the lactam function was essential for good binding to tubulin. Also, the size of the lactam ring and the bulkiness of the substituents present on the ring had an influenece in the interaction with microtubules.

In $1998,{ }^{59 a}$ they reported the synthesis of new $o$-substituted bridge biphenyls 356a to 356e, and showed that the more or less hindered substitution at carbon 9 affected the interaction with tubulin. Their approach was based on a cross-coupling reaction of a protected aniline derivative with $o$-substituted aryl bromide 357. This led to the key biphenyl intermediate 358, which was cyclized into a nine-membered ring after deprotection of the amine and acid groups followed by intramolecular cyclization in the presence of EDCI and HOBT to obtain 356a-e in good yields (Figure 3.4).

Figure 3.4

According to their results, the compounds 356a-e had the capacity to interact with tubulin in the same fashion as $(-)$-rhazinilam 283. However, compounds 356b, 356c, 356d, and 356e were respectively $20,17,8$, and 16 times less active than (-)-rhazinilam $\mathbf{2 8 3}$ and compounds 356a was inactive. The decrease of the conformational freedom along the biphenyl axis seemed to increase the activity of the compounds 356 . This was not relevant to $\mathbf{3 5 6} \mathbf{e}$, which suggested a direct interaction of the alkyl groups with tubulin.

To obtain compound 357 , monoalkylation and dialkylation of commercially available 2 bromophenylacetonitrile 359 was carried out, and this led to nitriles $360 \mathrm{a}-\mathrm{e}$, which then were reduced into the corresponding aldehydes 361a-e. These unstable aldehydes 361a-e were immediately subjected to the Horner-Wadsworth-Emmons (HWE) condition to afford
selectively trans-alkenes 362a-e with good yields, followed by catalytic hydrogenation to give the aryl bromides 357a-e (Scheme 3.7).

Scheme 3.7

Cross-coupling reaction of $N$-( $t$-butoxycarbonyl)-2-(trimethylstannyl)aniline $\mathbf{3 6 3}$ and the arylbromides $\mathbf{3 5 7}$ a-e gave 364a-e in yields ranging from $64 \%$ to $3 \%$ depending on the amount of steric hindrance in the arylbromides 357 (Scheme 3.8).

Scheme 3.8

Later on, more analogs ${ }^{59 b}$ had been prepared in the similar way to show the conformation of the B-ring (lactam), which could play a role in the binding (Scheme 3.9). Such an analog (-)365 showed that the replacement of the lactam by a urethane function was favourable for the binding with tubulin by possessing a better interaction than (-)-rhazinilam 283 and lactam 366. This work established the first features needed for maximum antitubulin activity.

365

367

366

$\mathrm{R}=\mathrm{R}^{\prime}=\mathrm{Et} 357$

Scheme 3.9

In 1999, Guenard and Guerritte ${ }^{63}$ further reported chemical modifications of the D-ring and the biological activity evaluation of these new D-ring substituted rhazinilam analogs. The synthesis strategy, using the semisynthetic pathway, starts from ( + )-vincadifformine $\mathbf{3 6 8}$ affording easily $(+)$-1,2-didehydroaspidospermidine $\mathbf{3 3 0}$ after acid treatment. By treating with $m$-chloroperoxybenzoic acid, and using a classical Polonovski conditions ( $\mathrm{Ac}_{2} \mathrm{O}$, triethylamine), a reproducible 'one pot' semisynthesis from 330 afforded (-)-rhazinilam 283 in $50 \%$ yield. This allowed the easy preparation of (-)-rhazinilam analogues substituted on the D-ring.
$(+)$-Vincadifformine 368 was protected by a Boc group to yield 369 , which then oxidized with bromine in THF:water to obtain $\mathbf{3 7 0}$ along with $\mathbf{3 7 1}$. Alkylation of $\mathbf{3 7 0}$ with ethyl iodide and benzyl bromide afforded the kinetically favoured 372 and 373 , respectively. The selective reduction of the $\mathbf{3 7 2}$ and $\mathbf{3 7 3}$ was performed with borane-THF complex at $0^{\circ} \mathrm{C}$ to obtain $\mathbf{3 7 4}$ and $\mathbf{3 7 5}$ in quantitative yield.

Compound 370 was also reacted with phenylselenenyl chloride and led to $\mathbf{3 7 6}$ in $80 \%$ yield. Elimination of the selenoxide group occurred smoothly to afford the $\alpha, \beta$-unsaturated amide 377, which then reduced selectively with diisobutylaluminium hydride to give 378 (Scheme 3.10 ).

$\uparrow$

Scheme 3.10

Decarboxylation and Boc-deprotection of $\mathbf{3 7 4}, \mathbf{3 7 5}$, and $\mathbf{3 7 8}$ with hydrochloric acid gave 1,2didehydroaspidospermidine derivatives $\mathbf{3 7 9}, \mathbf{3 8 0}$, and 381 in high yields. The 'one pot' semisynthesis was finally performed to give (-)-14 $\beta$-ethylrhazinilam 382, (-)-14 benzylrhazinilam 383, and (-)-14,15-didehydrorhazinilam 384 (Scheme 3.11).

## Scheme 3.11

This work provided information on the structure-activity relationship in the rhazinilam series. The substitution at position 14 with the hydrophobic ethyl and benzyl groups, 382 and 383, resulted in a clear decrease of the antitubulin activity comparing to (-)-rhazinilam 283. The unsaturated D-ring 384 was 2 times less active than (-)-rhazinilam 283. They suggested that these modified C -14 compounds might be in interaction with the binding site, related to a mode of action different from a direct interaction with microtubules.

### 3.3.5 Hetero-ring cross coupling

By means of a rapid and efficient construction of a library of analogues, a Suzuki crosscoupling reaction had influenced Ghosez ${ }^{45}$ (see Section 2.3.2, page 54), Guenard, and Guerritte ${ }^{58, \mathrm{~b}, 59 \mathrm{c}}$ to use this reaction as a key step, when approaching analogues of (-)rhazinilam 283.

Ghosez and co-workers ${ }^{45}$ reported the successful results in Suzuki coupling of 2-formyl-3iodopyrrole 134 with various arylboronic acids. The pyrrole 134 had been prepared in four steps from cinnamaldehyde, which was firstly converted into amide 386, followed by
cyclisation to give the pyrrole 387, and finally oxidative cleavage of the double bond using potassium permanganate to give the iodopyrrole 134 in $48 \%$ yield (Scheme 3.12).

## Scheme $\mathbf{3 . 1 2}$

To access 2-substituted-3-arylpyrrole 279 (Scheme 2.25, Section 2.32), a Suzuki reaction was performed with 1,1 '-bis-(diphenylphosphino)ferrocene (dppf) in the presence of barium hydroxide in DMF: $\mathrm{H}_{2} \mathrm{O}(4: 1)$ at $80^{\circ} \mathrm{C}$ in order to achieved high yields of coupling products.

In 2000, Guenard, and Guerritte ${ }^{58 \mathrm{~b}}$ reported the borylation of $o$-substitued aryl halides and 'one-pot' Suzuki cross-coupling reactions with $o$-substitued aryl iodides, yielding sterically hindered 2,2 '-disubstituted biphenyls. They showed that use of biphenylphosphine ligand $\mathbf{3 8 8}$ improved dramatically in the borylation process the presence of $5 \% \mathrm{~mol}$ of palladium acetate and four equivalents of triethylamine in dioxane (Scheme 3.13). This afforded the boronate 389 in $81 \%$ yield within an hour.

Scheme 3.13

With these good results, they also extended this methodology to the synthesis of $2,2^{\prime}$ biphenyls via 'one-pot' Suzuki cross-coupling reactions. After the boronation of 2bromoaniline was followed by addition of water, an equivalent of 2-iodophenylacetonitrile 390, excess barium hydroxide, and heating for an hour at $100^{\circ} \mathrm{C}$. The cross-coupling products 391a and 391b were obtained in $73 \%$ and $66 \%$, respectively (Scheme 3.14), which then could be further elaborated to give rhazinilam biphenyl analogues 365 (see Scheme 3.6, 3.7, and 3.8).

Scheme 3.14

In the same year, Guenard, and Guerritte ${ }^{58 \mathrm{a}}$ also reported the Suzuki cross-coupling reaction between 1,2,5-trisubstituted pyrrole halides and 2-N-( $t$-butoxycarbonyl)aminophenyl boronic acid. In this highly hindered coupling, the reactions were performed with benzyl[bis(triphenylphosphine)]palladium(II) chloride $\left(\mathrm{PdBnCl}\left(\mathrm{PPh}_{3}\right)_{2}\right)$ in a DMF: $\mathrm{H}_{2} \mathrm{O}$ solution in the presence of potassium phosphate. Under this condition reaction, the coupling between arylboronic acid 392 and pyrrole bromine 393 gave the 3-phenylpyrrole derivative 394 in a modest yield (48\%, Scheme 3.15).

Scheme 3.15

The pyrrole 393 was prepared from commercial 1-methyl-2-pyrroleacetonitrile 395, which was protected at carbon 5 with a trichloroacetyl group, followed by converting into bromide to give 3-bromopyrrole 397 in quantitative yield. Treatment of the 3-bromopyrrole 397 with
sodium methoxide led to 398 which was dialkylated to yield pyrrole 393 in $54 \%$ yield (Scheme 3.16).

Scheme 3.16

Finally, the phenylpyrrole 394 was treated with a $10 \%$ aqueous solution of hydrochloric acid to give the primary amide 399 , which was then converted into the analogue 400 after lactamization (Scheme 3.17). The phenylpyrrole was found to be inactive. This confirmed that the size of the lactam ring was playing an essential role in the inhibition of tubulin. So far, Guenard, and Guerritte suggested that the presence of a biaryl unit sustaining a ninemembered ring was crucial, as well as a quaternary center at the 13 position.

Scheme 3.17

In 2001, Guenard, and Guerritte ${ }^{59 \mathrm{c}}$ also reported the first total synthesis of phenylpyridine analogues, using Suzuki cross-coupling reactions as one of the key steps. Under a 'one-pot' procedure, commercially available 3-hydroxy-2-methylpyridine was used as starting material to synthesize the biaryl system by treating with triflic anhydride in pyridine for 45 minutes, then with 2-pivaloylaminophenylboronic acid, tetrakis(triphenylphosphine)palladium(0) in the presence of potassium carbonate in toluene:EtOH, to yield the biaryl 401 in $95 \%$ (Scheme 3.18).

The biaryl 401 was then treated with $n$-BuLi and dimethyl acetamide leading to the pyridylacetone 402 , which was followed by alkylation to afford the ketone 403 in good yield. The ketone 403 was then treated with acrylonitrile in the presence of benzyltrimethylammonium hydroxide to give the quaternary picolinic compound 404 in low yield, along with a byproduct. Compound 404 was reduced to the alcohol 405 with sodium borohydride and then dehydrated to vinyl compound $\mathbf{4 0 6}$ in hot HMPA and a presence of a small amount of sulfuric acid. The vinyl compound 406 was then converted into alkane 407a by catalytic hydrogenation. The lactam 408 was obtained in good yield by deprotecting the amine 407a to obtain amino acid 407b by aqueous sulfuric acid treatment followed by cyclization using the HOBT/EDCI system (Scheme 3.18).

The biological result showed the low activity of the lactam 408. According to the acidic character of tubulin, this might be due to protonation of the pyridine ring leading to an unfavorable charge distribution for the interaction with tubulin. Their best result was obtained for cyclic carbamate 409, which was synthesized using a similar strategy and had three times less active than (-)-rhazinilam 283.

## Chapter 4

## The first synthetic approach to Rhazinilam

### 4.1 Introduction

As shown in the previous Chapter, many groups have attempted to synthesise Rhazinilam 324 and its analogues. One well-designed route was based on the 3-(o-nitrophenyl)-pyrrole 280, as a key intermediate to establish the remainder of the structure elements (Chapter 3). To achieve a rapid and efficient access to the pyrrole 280, other new approaches are required. We were interested in the synthesis of ( - )-Rhazinilam 139, not only for its potential antitumor activity, but also in providing us with a synthetic challenge in applying two methodologies developed by our group: aldol reactions and 5-endo-dig iodocyclisations.

## Scheme 4.1

According to the retrosynthetic study of Rhazinilam 324, the disconnection of the amide functionality, followed by cleavage of the $o$-nitrophenyl group would lead to the iodopyrrole 118 (Scheme 4.1). It has previously been shown that the Suzuki reaction works successfully in this coupling. To obtain the iodopyrrole 118, 5 -endo-dig iodocyclisation would apply to the alkynyl- $\beta$-hydroxy- $\alpha$-amino ester 120, only if the aldol reaction could be applied successfully to a suitable $\alpha, \beta$-acetylenic aldehyde 122 (Scheme 4.2).

Scheme 4.2

410

411

## Scheme 4.3

To establish the entire structure elements, we planned to convert the enol ester 412 into the ester 410 by using one of three ring-opening approaches (Scheme 4.3): a) the direct ozonolysis of enol ester 412 (e.g.in $\mathrm{MeOH} / \mathrm{DCM}$ then $\mathrm{Ph}_{3} \mathrm{P}$ ), b) Baeyer-Villiger oxidation of enone 411 (urea-hydrogen peroxide, trifluoroacetic anhydride, sodium hydrogen phophate in DCM), or c) the epoxidation of the enol ester 412 followed by rearrangement and oxidative cleavage (MCPBA, acetic acid and sodium iodate). ${ }^{64}$ With Tsuji's oxidative rearrangement (methyl lithium, TMSCl, phenylselenenyl chloride, $\mathrm{H}_{2} \mathrm{O}_{2}$ ), the enone 411 could directly be prepared from the enol ester 412, which would be derived easily from the ketone 413.

To access the pyrrole 413, we believed that our previous studies (see Section 1.3.3 and 2.1.5) had established a promising route. We attempted to synthesize our key precursor, $\alpha, \beta$ acetylenic aldehyde 414, from 415, 416, or 417 as starting materials (Scheme 4.4), which then could be condensed with $N$-tosyl protected amino esters 154 (Chapter 2).

5-endo-dig iodocyclisations

416

417

Scheme 4.4

### 4.2 Synthesis

### 4.2.1 Route A

This seemed to be a direct approach to the aldehyde 414, using formylation of an acetylide (from 418) with DMF (Section 2.1.3). To access a quantity amount of the acetylene 418, we believed that a Grignard reaction would achieve a good result.

Scheme 4.5

Starting from commercially available ketone 415, we attempted to obtain a tertiary alcohol 419 by using ethylmagnesium bromide. The ketone was treated with ethylmagnesium bromide at $0^{\circ} \mathrm{C}$, then at room temperature for 16 hours to give the alcohol 419 in moderate yield $(10-30 \%)$. The ${ }^{1} \mathrm{H}$ NMR spectrum of the alcohol 419 showed the characteristic resonance for the protons of ethyl group at 0.89 ppm as a triplet $\left(\mathrm{CH}_{3}, J=7.5 \mathrm{~Hz}\right)$ and 1.48 ppm as a quartet $\left(\mathrm{CH}_{2}, J=7.5 \mathrm{~Hz}\right.$ ). This also confirmed by ${ }^{13} \mathrm{C}$ NMR (8-C, quaternary carbon, at 65.0 ppm ), and IR at $3456 \mathrm{~cm}^{-1}$.

Scheme 4.6

However, we faced the difficulty of purifying the alcohol 419. It is well recognized that the Grignard reaction is often accompanied by side reactions such as enolization and condensation. In 1989, Imamoto and co-workers ${ }^{65}$ found that anhydrous cerium chloride significantly promoted additions of Grignard reagents to carbonyl compounds with remarkable suppression of side reactions.

Imamoto and co-workers also prepared the similar alcohol and achieved a $30 \%$ yield along with $30 \%$ of by-product, using the cyclohexanone as a starting material. Herein, we were interested in enhancing the yields of the alcohol by using this method. Firstly, cerium chloride was finely ground to powder, and then heated gradually to $140^{\circ} \mathrm{C}$ with evacuation for an hour and an additional hour with a magnetic stirrer bar. After cooling the flask with nitrogen and an ice bath, tetrahydrofuran was added, and the suspension was vigorously stirred for 16 hours. This was ready to use in the Grignard reaction to give the alcohol 419 in reproducible yield of $30 \%$, but then problem of purification of the product remained (Scheme 4.6).

Although the reaction had been heated to reflux, it was still difficult to achieve a better yield of tertary alcohol 419. It was, therefore, desired to try an alternative approach to the acetylene 418. The alcohol 420 was prepared in $60 \%$ yield by using a modified procedure, ${ }^{66}$ treating the ketone 415 with lithium acetylide/ethylenediamine complex in THF (Scheme 4.7). To introduce into this compound an ethyl group, the hydroxy group of $\mathbf{4 2 0}$ was converted into the chloride 421, using thionyl chloride in DMF, in $34 \%$ yield (Scheme 4.7). ${ }^{67}$ This chloride 421
was confirmed by $8-\mathrm{C}$, quaternary carbon in ${ }^{13} \mathrm{C}$ NMR, which shifted to high field from 66.3 $\mathrm{ppm}(\mathrm{COH})$ to $55.7 \mathrm{ppm}(\mathrm{CCl})$.

Scheme 4.7

These was also obtained an undesired compound 422 in $40 \%$ yield which showed, in the ${ }^{1} \mathrm{H}$ NMR spectrum, a proton of the double bond at $6.31-6.33 \mathrm{ppm}$ as a multiplet and $8-\mathrm{C}$ in ${ }^{13} \mathrm{C}$ NMR at 132.7 ppm . By following the tlc during the reaction, it was suggested that dehydration mainly occurred during the reaction along with chlorination. Unfortunately, we found that the chloride 421 failed to react with the Grignard reagent, ethylmagnesium bromide. ${ }^{68}$ So, this route was stopped at this stage to investigate a better approach to the acetylene 418.

### 4.2.2 Route B

## Scheme 4.8

In 1990, Kende and Fludzinki ${ }^{69 a, b}$ demonstrated the conversion of cyclohexane-1,3-dione 416 into 8-methynyl-8-methyl-1,4-dioxa-spiro[4.5]dec-6-ene 423 in good yield. This would be a
rather straightforward approaching to the alkynal 424 (Scheme 4.8), after elimination of the dichloride of dichlorovinyl compound $\mathbf{4 2 5}$, using $n$-butyllithium, and then direct formylation.

Cyclohexenone 426 can be formed in a yield of about $40 \%$ by heating a solution of cyclohexane-1,3-dione 416, ethanol, and $p$-toluenesulfonic acid in benzene (Scheme 4.9). ${ }^{69 \mathrm{c}}$ Ethylation between the lithium enolate derived from 426 and iodoethane gave 6-ethyl cyclohexenone 427 in $62 \%$ yield, which was obtained only when zinc chloride and DMPU ${ }^{70}$ were used as a mild Lewis acid and a co-solvent, respectively.

Scheme 4.9

By using HPMA in the alkylation of the cyclohexenone 427, the 6-dichlorovinyl-6-ethyl cyclohexenone 428, was obtained in $75 \%$ yield, having the quaternary carbon on C-6 (at 54.8 ppm in ${ }^{13} \mathrm{C}$ NMR).

1) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}$
2) Acidic work-up 41\%

Scheme 4.10

The sequential action of lithium aluminium hydride followed by an acidic work-up, on compound 428, gave the ketone 429 ( $41 \%$ yield); subsequent treatment with ethylene glycol then gave the protected ketone $\mathbf{4 2 5}$ in excellent yield (Scheme 4.10). ${ }^{69}$

Compound 425 was confirmed by ${ }^{1} \mathrm{H}$ NMR ( CHs of the double bonds showed $\mathrm{CH}=\mathrm{CH}$ at 5.55 and 6.18 ppm as doublets with $J=10.4 \mathrm{~Hz}$ and CHCl at 6.30 ppm as a singlet), ${ }^{13} \mathrm{C}$ NMR (8-C, quaternary carbon showed at 34.8 ppm and CHs of the double bonds showed $\mathrm{CH}=\mathrm{CH}$ at $125.7,135.9 \mathrm{ppm}$ and $\mathrm{ClC}=\mathrm{CHCl}$ at $125.7,143.1 \mathrm{ppm}$ ), IR , low resolution MS $\left(263[\mathrm{M}+\mathrm{H}]^{+}\right)$, and high-resolution MS (263.0607 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

To prepare a 1 -alkyne (e.g. 430) from the corresponding 1,2-dichloro-alkene, Kende and Fludzinki ${ }^{69 b}$ used two equivalents of $n$-butyllithium. Similarly, exposure of 8 -dichlorovinyl compound $\mathbf{4 2 5}$ to two equivalents of $n$-butyllithium, followed by two equivalents of $N, N$ dimethylformamide accomplished a one-pot formylation and led to the facile formation of our key precursor 424 (Scheme 4.11).

Scheme 4.11

This aldehyde 424 was confirmed using IR $\left(1666 \mathrm{~cm}^{-1}\right)$, mass spectrometric ( $221[\mathrm{M}+\mathrm{H}]^{+}$), ${ }^{1} \mathrm{H}$ NMR (CHO at 7.79 ppm as a singlet), ${ }^{13} \mathrm{C}$ NMR (a triple bond at $71.5,82.8 \mathrm{ppm}$ and the carbonyl group at 176.9 ppm ) data and high-resolution MS (221.1173 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

Treatment of the $N$-tosyl protection amino ester 234 and tin(II) chloride with lithium diisopropylamide resulted in the formation of the tin enolate 121 which was subsequently employed in an aldol condensation with the propynal 424 (Section 2.1). This provided a $2: 3$ mixture of adducts 431 and 432 in $24 \%$ yield. After purification by chromatography, $\beta$ -hydroxy- $\alpha$-amino ester 431 was identified by ${ }^{13} \mathrm{C}$ NMR ( $\beta$ - and $\alpha$-carbon at 60.8 and 63.4 ppm), IR (broad at $3464 \mathrm{~cm}^{-1}$, strong at 2232, 1745, $1668 \mathrm{~cm}^{-1}$ ), low resolution MS (464 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$, and high-resolution MS (481.2005 $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$). We observed an anti:syn ratio of diastereoisomers that was approximately 76:24 according to the ${ }^{1} \mathrm{H}$ NMR spectrum.

The ${ }^{13} \mathrm{C}$ NMR spectrum of $\beta$-hydroxy- $\alpha$-amino ester 432 showed the characteristic resonance of $\alpha$ - and $\beta$-carbons at $60.7,63.8 \mathrm{ppm}$ and the carbonyl group (ketone) at 199.2 ppm , IR (broad at $3488 \mathrm{~cm}^{-1}$, strong at $1744,1662 \mathrm{~cm}^{-1}$ ), low resolution MS ( $420[\mathrm{M}+\mathrm{H}]^{+}$), and Highresolution MS (420.1478 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$. From ${ }^{1} \mathrm{H}$ NMR spectrum, an anti:syn ratio of diastereoisomers was approximately 83:17.

Scheme 4.12

The ketone 432 had presumably arisen from the intermediate 433, a process that was likely induced by one of the ketal oxygen atoms trapping the proton from the buffer solution and then being ready cleavage by water (Scheme 4.12). Although this route provided a reasonable yield of the propynal 424, the aldol condensation obtained the desired adduct 431 in low yield ( $10 \%$ ), mixed with the ketone 432 as a major adduct ( $14 \%$ yield). It was thus shown that the propynal 424 was not compatible with this aldol condensation.

It was suggested that hydrogenation of the 4 -dichlorovinyl cyclohex-2-enone 429 to the 4 dichlorovinyl cyclohexanone 434 might provide a solution in this aldol reaction. The action of palladium ( $\mathrm{Pd} / \mathrm{C}$ ) in methanol on the cyclohex-2-enone 429 gavethe desired cyclohexanone 434, and also further reduction of the vinyl group to give cyclohexanone 435. This mixture was difficult to separate; therefore, this route was stopped to focus on the last precursor 417 (Scheme 4.13).

Scheme 4.13

### 4.2.3 Route C

In 1996, Bestmann and co-workers ${ }^{71}$ reported the transformation of aldehydes into terminal alkynes using the reagent dimethyl 1-diazo-2-oxopropylphosphonate $\mathbf{4 3 6}$ (Scheme 4.14). The key reagent 436 can be obtained in good yield from commercially available dimethyl-2oxopropylphosphnate in a single step by diazo transfer with $\mathrm{TsN}_{3}{ }^{72}$

Scheme 4.14

If this could be applied to the aldehyde 438, direct formylation would then furnish the propynal 437 as a potential precursor. In the synthetic direction, an oxidation of the alcohol derived from the ester 439 could afford the aldehyde 438, while the ester 439 could arise through alkylation of $p$-methoxybenzyl (PMB) ether, which can be produced by protecting the commercial available alcohol 417, with bromoethane (Scheme 4.15). The application of this basic plan is described below.

Scheme 4.15

Ethyl 4-hydroxy-cyclohexanecarboxylate $\mathbf{4 1 7}$ was treated with PMB trichloroacetimidate 440 and a small amount of PPTS to give a PMB ether 441 in $91 \%$ yield. ${ }^{73}$ Exposure of the ether 441 to 1.2 equivalents of LDA and bromoethane resulted in the formation of the desired ester 439, having a C-1 quaternary carbon (at 47.3 ppm in ${ }^{13} \mathrm{C}$ NMR spectrum), in $92 \%$ yield (Scheme 4.16). The action of lithium aluminium hydride in diethyl ether at $-78^{\circ} \mathrm{C}$ induced smooth reduction of the ethyl ester 439 and gave the alcohol 442 in an excellent yield of $94 \%$.

417

DCM, 2hr.
60\%

443

Scheme 4.16

The ${ }^{1} \mathrm{H}$ NMR spectrum of the alcohol 442 showed the characteristic resonance for $\mathrm{CH}_{2}$ protons next to the hydroxy group at 3.45 ppm as a singlet. The structure 442 was also
confirmed by ${ }^{13} \mathrm{C}$ NMR (quaternary carbon at 36.6 ppm ), IR (broad at $3414 \mathrm{~cm}^{-1}$ ), low resolution MS (279 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$and high-resolution MS (296.2228 $\left.\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}\right)$.

Oxidation of the primary alcohol in 442 with PCC gave the aldehyde 443 in $60 \%$ yield and the carbonyl group was indicated at 212.3 ppm in the ${ }^{13} \mathrm{C}$ NMR spectrum. When the aldehyde 443 was stirred in the presence of the reagent 436 and potassium carbonate for 3 days, acetylene 444 was formed in $86 \%$ yield (Scheme 4.17).

The acetylene 444 was indicated by ${ }^{1} \mathrm{H}$ NMR (a proton of the terminal alkyne at 2.08 ppm as a singlet, ${ }^{13} \mathrm{C}$ NMR (carbons of the triple bond at 69.3 and 88.7 ppm ), IR (at $2105 \mathrm{~cm}^{-1}$ ), and low resolution MS $\left(273[\mathrm{M}+\mathrm{H}]^{+}\right)$. The completion of the synthesis of the aldehyde 445 only required the direct formylation, which was achieved in an excellent yield of $95 \%$. This was confirmed by ${ }^{13} \mathrm{C}$ NMR (the carbonyl group at 177.2 ppm ), IR ( $1665 \mathrm{~cm}^{-1}$ ), low resolution MS (301 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$and high-resolution MS (318.2065 $\left.\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}\right)$.

445

## Scheme 4.17

We are now in a position to address the crucial aldol condensation of the aldehyde 445 with a tin enolate 121. After repeating this condensation several times, it was found that the optimum yield of aldol adducts 446 was $15 \%$ as a $75: 25$ ratio of anti:syn diastereoisomer (Scheme 4.18). Only small amount of this compound was obtained, and it was used for full characterization only.

The $\beta$-hydroxy- $\alpha$-amino ester 446 indicated by ${ }^{1} \mathrm{H}$ NMR (the $\alpha$-proton to the ester group at 4.06 ppm as a double doublet $[J=9.3$ and 3.6 Hz , also coupling with a proton of amino
group]), and the $\beta$-proton at 4.61 ppm as double doublets [ $J=10.5$ and 3.6 Hz , also coupling with a proton of hydroxy group]), ${ }^{13} \mathrm{C}$ NMR ( $\beta$ - and $\alpha$-carbon at 52.8 and 58.1 ppm ), IR (broad at $3286^{-1}$, strong at $\left.1514,1248,1164 \mathrm{~cm}^{-1}\right)$, low resolution MS $\left(544[\mathrm{M}+\mathrm{H}]^{+}\right)$and high-resolution MS (544.2371 [M+H] ${ }^{+}$).

Scheme 4.18

### 4.2.4 Route $D$ (alternative to route $A$ )

Scheme 4.19

We investigated this approach along with route B and C due to the apparent easy access of this route, which might provide a good result. It was anticipated that acetylene 418 derived from the dibromo compound 447 would be ready to perform the direct formylation. After elimination of the ester 448, a double bond would then undergo bromination to give the dibromo compound 447. Claisen rearrangement of the mixed-ketene acetal 449 was expected to play a key role in the synthesis of the ester 448. A Wittig or a related reaction of commercially available ketone $\mathbf{4 1 5}$ could be relied upon to establish the unsaturated ester 451. Through reduction of the ester 451, alcohol $\mathbf{4 5 0}$ could be derived (Scheme 4.19).

It has been considered that the advantages of the microwave in organic synthesis are to accelerate organic reactions and reduce the reaction times substantially. ${ }^{74}$ In conventional condition of Claisen rearrangement, a reaction mixture in a sealed tube would be heated up to $180^{\circ} \mathrm{C}$ for 48 hours, while using the microwave oven could provide a much more simple and convenient procedure. Srikrishna and Nagaraju ${ }^{75}$ reported the use of a commercial microwave oven for this ortho-ester Claisen rearrangement. However, in our facility, we used a microwave designed for laboratory use, and it was therefore necessary to investigate various conditions to achieve a suitable outcome.

The ketone 415 was converted into the intermediate ester 451 by a Wadsworth-Emmons reaction. Reduction of the ester $\mathbf{4 5 1}$ using lithium aluminium hydride afforded the alcohol 450 in low yield, but the action of Dibal-H in toluene at $-78^{\circ} \mathrm{C}$ induced a better yield of the alcohol 450 (62\%; Scheme 4.20) ${ }^{76}$

Scheme 4.20

When a solution of unsaturated alcohol 450 and triethyl orthoacetate in $\mathrm{DMF}^{75}$ was placed in a sealed tube under microwave conditions (optimized conditions: power $30 \mathrm{~W}, 100^{\circ} \mathrm{C}$, pressure $250 \mathrm{psi}, 15 \mathrm{~min}$.), the ortho ester Claisen rearrangement proceeded to give an intermediate 452 ( $20 \%$ yield) and a dehydration product 453 ( $18 \%$ yield) mixed with the desired ester 448 ( $51 \%$ yield, Scheme 4.21). The optimization of the microwave conditions, to achieve either only or mainly the ester 448, are shown in Table 4.1.

According to Srikrishna and S. Nagaraju's report, ${ }^{75}$ their procedure could accelerate the threestep ortho ester Claisen rearrangement (from $\mathbf{4 5 0}$ to 448), but, under our reaction conditions, elimination of water to give 453 and uncompleted rearrangement of the intermediate 452 was observed in high ratio at $90^{\circ} \mathrm{C}$ and $120^{\circ} \mathrm{C}$ (entry 1 and 6 , Table 1 ).

Scheme 4.21

Table 4.1: The optimization of the microwave condition for the ortho ester Claisen rearrangement.

| Entry | temperature $\left({ }^{\circ} \mathrm{C}\right)$ | time(min.) | $\mathbf{4 4 8}$ | $\mathbf{4 5 2}$ | $\mathbf{4 5 3}$ |
| :--- | :---: | :---: | :--- | :--- | :--- |
| 1 | 120 | 10 | 1 | 1.2 | 2 |
| 2 | 100 | 10 | 2.5 | 1.25 | 1 |
| 3 | 100 | 15 | 3.5 | 1 | 1 |
| 4 | 100 | 20 | 3 | 1 | 2 |
| 5 | 100 | 30 | 4 | 1 | 3 |
| 6 | 90 | 15 | 1 | 2 | 3 |
| $7 *$ | 100 | 15 | 1.4 | 2.8 | 1 |
| $8^{*}$ | 100 | 20 | 2 | 14 | 1 |

Note: the reaction was on 100 mg scale. ${ }^{*}$ for entry 7-8 on a gram scale.

In addition, the diene 453 was produced in all the tested conditions. We could only minimize this by-product $\mathbf{4 5 3}$ by reducing the reaction times from 30 min to 15 min (entry 3,4 and 5, Table 1). The results of varying times showed that the rearrangement required more than 10 min to give a satisfying portion of the desired products, a mixture of 448:452:453 at 3.5:1:1 (entry 2 and 3 , Table 1). We attempted to scale-up this reaction from 0.1 -gram to one-gram scale, and the expected product mixtures had changed. In fact, the reaction also varied on the scale of the reaction. This brought an obstacle to access to the dibromo compound 447. We therefore stopped this route at this stage.

### 4.3 Conclusion

We had adopted, what we thought, were convenient routes to the acetylene aldehyde 414 and related structures. However, through the our course of our syntheses, route A and B proved unproductive strategies via Grignard reagent or Claisen rearrangement, but route B and C proved high-yielding approaches to our desired precursor, the aldehyde 414. Unfortunately, neither of the derived ynals $\mathbf{4 2 4}$ nor $\mathbf{4 4 5}$ performed well in the aldol reaction. It may be due to the complexity of both compounds. Nevertheless, route C provided the most appealing strategy according to the ease of each reaction and low-toxic reagents used. At this time of despair, a new methodology of metal-mediated cyclization was developed in Sector 2.5 and this appeared to offer an alternative approach to our target molecule. The project still intended to achieve at least the key pyrrole 280.

## Chapter 5

## The second synthetic approach to Rhazinilam

### 5.1 Application of Silver-Mediated Cyclization

We reasoned that a silver-mediated cyclization would be ideal for the alternative preparation of (-)-Rhazinilam 283 (Section 2.5). To test the generality of this methodology in preparing a simple precursor 456, we designed a pyrrole 455 with a bulky substituent, a tert-butyl group, in the 2-position and a o-nitrophenyl or other nitrogen group in the 3-position. Alternatively, to avoid N-protection, a bromine could be incorporated to allow late introduction of the nitrogen by a Buchwald-Harwig method.

Scheme 5.1

To obtain the pyrrole 455, silver-mediated cyclization would have to be applied to the $\gamma$ -alkynyl- $\beta$-hydroxy tosylamide 456. This could be generated by the addition of acetylene to the amino ketone 457, which is derived from an oxidation of an amino alcohol 458. The alcohol 458 can be prepared, it appeared, in a productive fashion by ring opening of an aziridine 459 using acid hydrolysis. Compound 459 could conceivably be formed in one step through coupling of intermediates 460 and 461 using Aggarwal's aziridination technology (Scheme 5.1). ${ }^{77}$ In section 5.3, which follows, the reaction sequences culminating in the synthesis of the pyrrole $\mathbf{4 5 5}$ are presented.

### 5.2 Aziridination

These are two direct routes to aziridines that also lend themselves to asymmetric catalysis: the addition of nitrenoids to alkenes (route A ) and the addition of carbenes/carbenoids to the imines (route B), as shown in Figure 5.1.

Figure 5.1

### 5.2.1 Alkene Aziridination

Nitrogen atom transfer reactions constitute an important area of research in bioinorganic and organic chemistry. The importance of alkene aziridination reactions in the construction of carbon-nitrogen bonds is well documented in the literature. ${ }^{78} \mathrm{The}^{\mathrm{Cu}^{\mathrm{I}} \text { or } \mathrm{Mn}^{\text {III }} \text { complexes }}$ discovered by Evans, ${ }^{78 a}$ Jacobsen, ${ }^{78 b}$ and Katsuki ${ }^{78 c}$ represent efficient catalysts for asymmetric aziridinations when [ N -(p-toluenesulfonyl)imino]phenyliodinane, $\mathrm{PhI}=\mathrm{NTs}$, is used as a nitrogen source. Evans and co-workers reported that, under standard conditions (acetonitrile, $5-10 \% \mathrm{Cu}$-catalyst, 1 equiv of $\mathrm{PhI}=\mathrm{NTs}, 5$ equiv of olefin, $0.4 \mathrm{M}, 25^{\circ} \mathrm{C}$ ), the catalyzed aziridination reaction proceeded in good yields with both aromatic and aliphatic olefins. For example, with phenyl substituted olefins 462, both $\mathrm{Cu}^{1}$ and $\mathrm{Cu}^{\mathrm{II}}$ afforded high yields of aziridine 463 (Scheme 5.2).

Scheme 5.2

Chiral ligands have since been developed to generate chiral copper catalysts and achieve high enantiopurity in the resulting aziridines (Scheme 5.3). ${ }^{79}$

Jacobsen

Scheme 5.3

Komatsu ${ }^{78 \mathrm{~d}}$ reported the asymmetric aziridination of styrene derivatives by transfer of a nitrogen atom from a chiral nitridomangenese complex 466 (Scheme 5.4).

## Scheme 5.4

### 5.2.2 Ylide Mediated Catalytic Aziridination

In a series of elegant experiments, Jacobsen and co-workers ${ }^{80}$ showed that there are two pathways leading to the aziridine $\mathbf{4 7 0}$ (Scheme 5.5): one bearing the chiral metal species 469 which yielded the non-racemic aziridine and the second a planar azomethine ylide 471 which gave the racemic aziridine.

$$
+\mathrm{L}_{2} \mathrm{Cu}^{+} \mathrm{X}^{-} \|-\mathrm{L}_{2} \mathrm{Cu}^{+} \mathrm{X}^{-}
$$

Scheme 5.5

Jacobsen and co-workers ${ }^{80}$ further proved this by trapping the azomethine ylide 471 with dipolarophile, $\mathrm{EtO}_{2} \mathrm{CCH}=\mathrm{CHCO}_{2} \mathrm{Et} 472$. Evidently, the problem with the addition of metal carbenes to imines is that the $\mathrm{C}-\mathrm{N}$ bond is formed before the $\mathrm{C}-\mathrm{C}$ bond, which leads to a planar azomethine ylide 471 if the metal is lost. If the C - C bond could be formed ahead of the C-N bond, then it would not be possible to form the achiral azomethine ylide 469.

One approach, which allows $\mathrm{C}-\mathrm{C}$ bond formation ahead of $\mathrm{C}-\mathrm{N}$ formation is the reaction of a sulfur ylide with an imine. In 1996, Aggarwal and co-workers reported aziridination process mediated by sulfur ylides. ${ }^{81 a}$ Their proposed catalytic cycle for aziridination involves the slow addition of a diazo compound to solution of a suitable metal salt, sulfide, and imine. The reaction proceeds through the intermediacy of diazocompounds, metal carbenes and sulfur ylide as shown in Scheme 5.6. High yields of aziridines were achieved using $1 \% \mathrm{~mol}$ of $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}$ and one equiv of dimethyl sulfide; high enantioselectivity came from the use of enantiomerically pure sulfides.

Scheme 5.6

In 2001, ${ }^{81 \mathrm{~b}}$ a highly effective catalytic asymmetric process for the aziridination of imines was developed, which can be applied to a broad range of electrophiles 474 and diazo precursors (Scheme 5.7). High enantioselectivity of the aziridines 476 is obtained by using a chiral sulfide 475.

## Scheme 5.7

In 1998, Dai and co-workers reported the ylide aziridination of $N$-sulfonylimines with sulfonium propargylide under mild reaction conditions. ${ }^{82}$ The best base/solvent combination for this reaction was found to be $\mathrm{Cs}_{2} \mathrm{CO}_{3} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ allowing both high yield and high cis selectivity could be achieved (Scheme 5.8).

## Scheme 5.8

### 5.3 Synthesis

### 5.3.1 Approaching the aziridine 459

It was our intention to develop a convenient route to access the $\gamma$-alkynyl- $\beta$-hydroxy tosylamide 456 starting from an aziridine. Firstly, copper-catalyzed aziridination ${ }^{72 \mathrm{a}}$ of olefins 480 and 481 using $\mathrm{PhI}=\mathrm{NTs}$ was explored. According to Evans methodology, the olefins 475a or 475b was treated with $\mathrm{PHI}=\mathrm{NTs}$, and a catalytic amount of $\mathrm{Cu}(\mathrm{acac})_{2}$ in acetonitrile at room temperature for 16 hours, but the desired aziridines 482 or 476 were not obtained (Scheme 5.9).This may be due to the highly hindered nature of the olefins.

Scheme 5.9

A Suzuki coupling reaction has been used to prepare the olefin 480. ${ }^{83}$ Treatment of iodonitrobenzene 483 with dioxaborole 485 (prepared by hydroboration of the 3,3-dimethyl-but-1-yne 227 with catecholborane 484) in tetrahydrofuran with $3 \% \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ in the presence of NaOH under reflux generated the olefin 480 in $68 \%$ yield (Scheme 5.10). This olefin $\mathbf{4 8 0}$ confirmed by ${ }^{1} \mathrm{H}$ NMR ( CHs of the double bonds showed resonances at 6.15 and 6.71 ppm as doublets with $J=16 \mathrm{~Hz}$ ), ${ }^{13} \mathrm{C}$ NMR (CHs of the double bonds showed resonances at 121.8 , and 139.6 ppm ), IR, low resolution MS ( $206[\mathrm{M}+\mathrm{H}]^{+}$) and highresolution MS (223.1447 $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$).

Scheme 5.10

A Wittig reaction, however, was used to prepare the olefin 481. ${ }^{84}$ Pivaldehyde was simply treated with the phosphonium salt derived from 2-bromobenzyl bromide and
triphenylphosphine yielding desired olefin 481 in $60 \%$ yield (Scheme 5.11). In the ${ }^{1} \mathrm{H}$ NMR spectrum, the protons of the double bond appear as doublets at 5.58 and 6.13 ppm with $J=$ 12.5 Hz .

Scheme 5.11

The aziridination through the reaction of an imine with an ylide has recently shown great promise in obtaining various functionalized aziridines (Scheme 5.7 and 5.8). ${ }^{81,82}$ An aziridination of $N$-sulfonylimine 478 with sulfonium ylide $\mathbf{4 8 8}$ or $\mathbf{4 8 9}$ derived from benzyl bromide 490 and 486, respectively, with dimethyl sulfide in water under reflux, has been explored by their reaction with $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ in dichloromethane. Unfortunately, neither of the desired aziridines $\mathbf{4 5 9}$ nor $\mathbf{4 7 6}$ could be obtained (Scheme 5.12).

$\mathrm{R}=\mathrm{NO}_{2} \mathbf{4 9 0}$
$\mathrm{R}=\mathrm{Br} 486$

$$
\mathrm{R}=\mathrm{NO}_{2} \mathbf{4 8 8}
$$

$$
\mathrm{R}=\mathrm{Br} \quad 489
$$

## Scheme 5.12

Finally, Aggarwal's aziridination technology ${ }^{81 b}$ was applied to the preparation of the aziridines 459 or 482. In order to follow on this procedure, an imine 478 and diazo precursors 491 and 492 were required. Treatment of commercially available pivaldehyde with $p$ toluenesulfonamide monohydrate, $4 \AA$ molecular sieves and a catalytic amount of boron trifluoride etherate in toluene under reflux for 16 hours resulted in the formation of the imine 478 in $93 \%$ yield (Scheme 5.13). ${ }^{85}$ The synthesis of the tosylhydrazone sodium salt
commences with the formation of tosylhydrazones 491 and 492, followed by formation of the sodium salts 493 and 494.

## Scheme 5.13

Benzaldehydes 493 and 494 can be condensed in a straightforward manner by treatment with $p$-toluenesulfonylhydrazide in methanol. The tosylhydrazone 482 is then collected by Büchner filtration as a colourless solid in good yield (Scheme 5.14). ${ }^{86}$ Exposure of dry tosylhydrazone 491 and 492 with a solution of $25 \%$ sodium methoxide in methanol results the formation of the intermediate 495 and 496, respectively.

## Scheme 5.14

Construction of the key intermediates $\mathbf{4 5 9}$ and $\mathbf{4 8 2}$ could now be examined. The aziridination of the tosylhydrazone sodium salt 496 with the imine 478 in the presence of a catalytic amount of rhodium acetate, $\mathrm{BnEt}_{3} \mathrm{~N}^{+} \mathrm{Cl}^{-}$[as a phase transfer catalyst], and tetrahydrothiophene in dioxane at $60^{\circ} \mathrm{C}$ furnished the desired cis-aziridine 459 in a yield of $60 \%$ (Scheme 5.15). Unfortunately, exposure of the tosylhydrazone sodium salt $\mathbf{4 9 5}$ to the same condition gave no trace of the aziridine 482.

Scheme 5.15

The ${ }^{1} \mathrm{H}$ NMR spectrum of the aziridine 459 showed characteristic resonances for the two protons of the aziridine ring at 2.84 and 3.81 ppm as doublets $(J=7.4 \mathrm{~Hz}$, showing cisconformation). This was also confirmed by ${ }^{13} \mathrm{C}$ NMR (these two carbons of the aziridine ring at 47.4 and 55.2 ppm$)$, low resolution MS $\left(408\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$and high-resolution MS $\left(408.0631\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$.

trans-459

Figure 5.1: Approach of the ylide to the imine.

Aggarwal's studies on the mechanism of epoxide formation, ${ }^{87}$ which we applied to aziridine formation (Figure 5.1), suggest that the overall reaction mechanism consists of two separate steps: initial rotation around the C-C single bond of the initially formed cisoid betaine anti-

499 to form its transoid rotamer anti-500; and ring-forming elimination via $\mathrm{S}_{\mathrm{N}} 2$-like substitution from the latter (route A, Figure 5.1).

According to the ${ }^{1} \mathrm{H}$ NMR spectrum of the aziridine 459, the observed cis-diastereoselectivity can be explained by comparing the two possible transition state having the two developing charges in an electronically favored gauche arrangement, as shown in routes A and B (Figure 5.1). That leading to the trans-459 is less favoured, as it possesses three sterically demanding gauche interactions.

### 5.3.2 Ring Opening of the aziridine 459

The chemistry of aziridines continues to attract the attention of the synthetic community. ${ }^{88}$ This interest is driven by the useful properties of aziridines centered on their ring-opening transformations. The reactivity of aziridines as carbon electrophiles makes them versatile nitrogen-containing building blocks for the synthesis of biologically important compounds. ${ }^{89}$

$$
\begin{array}{cc}
{[\mathrm{N}-\mathrm{X}} & \begin{array}{c}
\mathrm{N}-\mathrm{R} \\
\mathrm{X}=\mathrm{COR}, \mathrm{CO}_{2} \mathrm{R}, \mathrm{SO}_{2} \mathrm{R}
\end{array} \\
\mathrm{R}=\mathrm{H}, \text { alkyl }
\end{array}
$$

Figure 5.2. Activated and nonactivated aziridines

Aziridines can be divided into two classes depending on the nature of the $N$-substituent (Figure 5.2). Activated aziridines, such as $N$-tosyl and $N$-acyl aziridines, contain a strongly electronegative substituent that facilitates their ring-opening chemistry. Nonactivated aziridines, such as alkyl aziridines, do not have a substituent that is capable of stabilizing the anion resulting from the ring opening.

Scheme 5.16

In 1994, Davis and co-workers reported the regioselective ring opening of a 3-phenyl-2carbomethoxyaziridine 501 by heating at $45^{\circ} \mathrm{C}$ for 6 hours in $50 \%$ aqueous TFA, and then
neutralizing with concentrated ammonium hydroxide to obtain syn- $\beta$-phenylserine derivative 502 as a $93: 7$ mixture of diastereoisomers (Scheme 5.16). ${ }^{90}$

Also, in 1999, Tamamura and co-workers showed that the TFA-mediated ring-opening reaction was useful for the convenient synthesis of the diastereomerically pure $\delta$-aminated $\gamma$ hydroxy $\alpha, \beta$-enolates, such as 503 , as the key intermediates for several bioactive compounds, such as sphingosine 504 (Scheme 5.17). ${ }^{90 b}$

Scheme 5.17

Later, in 2000, Singh and co-workers reported the Lewis acid-induced ring opening of N substituted aziridines with water, primary, allylic, and propargylic alcohols. Since both $\mathrm{Sn}(\mathrm{TfO})_{2}$ and $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$ turned out to be highly effective for the aziridine opening, the reaction was extended to the use of water and the product 507 was obtained in high yield (90$92 \%$, Scheme 5.18). ${ }^{90 \mathrm{c}}$

Scheme 5.18

In 2001, Nakayama and coworkers ${ }^{90 d}$ found that $N$-tosylaziridines undergo an acid-catalyzed aza-pinacol rearrangement under mild conditions to give the corresponding $N$-tosylimines. ${ }^{90 \mathrm{~d}}$ When the reaction of 509 with $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$, carried out at $-18^{\circ} \mathrm{C}$, was quenched after 6 hours by addition of aqueous sodium hydrogen carbonate, the amino alcohol 498 was isolated in $39 \%$
yield in addition to the $N$-tosylimine 511 in $55 \%$ yield (Scheme 5.19). Thus, this chemistry is not as simple as it might appear!

Scheme 5.19

In the mechanism of the rearrangement of aziridine 509, the initial step would involve the formation of carbocation intermediate 512, which yields amino alcohol 510 by hydrolysis. The carbocation 512 is stable enough to suppress fluoride migration; hence imine 511 is directly formed by methyl migration. Although an $\beta$-amino alcohol could potentially be derived in short order from the aziridine 459, an intermediate 513 is rather different, particularly with a tert-butyl substituent, which is a very good migratory group.

Figure 5.3. Regiochemistry.

A carbocation intermediate $\mathbf{5 1 4}$ should be highly favoured, due to the benzene ring stabilizing the cation, when compared with the alternative carbocation intermediate 515 (Figure 5.3). This could permit the formation of the $\beta$-amino alcohol 458, when a nucleophilic attack takes place; however, a formation of an imine 516 would be expected, to some extent at least.

Subjection of the aziridine $\mathbf{4 5 9}$ to the action of trifluoroacetic acid resulted in the formation of trifluoroacetate 517, which is afforded by a regiospecific ring-opening reaction (Scheme 5.20). The intermediate 517 is stable enough for chromatographic purification and characterization. The ${ }^{1} \mathrm{H}$ NMR spectrum of the trifluoroacetate 517 showed the resonance for the proton $\beta$ to the ester group at 3.72 ppm as a double doublet ( $J=10.4$ and 1.0 Hz ) and the proton $\alpha$ at 4.73 ppm as a doublet ( $J=10.4 \mathrm{~Hz}$ ). This was further confirmed by low resolution MS $\left(525[\mathrm{M}+\mathrm{H}]^{+}\right)$. Fortunately, no products arising from the alternative aza-pinacol process were observed.

Scheme 5.20

The subsequent hydrolysis of trifluoroacetate $\mathbf{5 1 7}$ yielded the $\beta$-amino alcohol $\mathbf{4 5 8}$ in $80 \%$ yield based upon aziridine 459. The ${ }^{1} H$ NMR spectrum of 458 showed the resonance for the proton $\beta$ to the hydroxy group at 4.18 ppm as a double doublet ( $J=9.6$ and 1.1 Hz ) and the proton $\alpha$ at 5.04 ppm as a doublet ( $J=9.6 \mathrm{~Hz}$ ). Surprisingly, we observed one proton at 5.33 ppm as a sharp singlet, which must be due to the NH group. It was surprising to observe no coupling with the proton $\alpha$ in this case. However, the structure of $\mathbf{4 5 8}$ was also confirmed by ${ }^{13} \mathrm{C}$ NMR (the carbons $\alpha$ and $\beta$ appearing at 64.9 and 71.2 ppm ), IR (broad at $3504 \mathrm{~cm}^{-1}$ ), low resolution MS (407 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)-\mathrm{H}_{2} \mathrm{O}\right]^{+}\right)$and high-resolution MS (443.1004 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{NH}_{4}\right]^{+}\right)$.

### 5.3.3 Approaching the pyrrole 455

Oxidation of the hydroxy group in $\mathbf{4 5 8}$ with pyridinium chlorochromate in dichloromethane furnished the corresponding ketone 457 (Scheme 5.21). The ketone 457 was indicated by ${ }^{1} \mathrm{H}$ NMR (the $\alpha$-proton to the carbonyl group at 4.33 ppm as a doublet $[J=10 \mathrm{~Hz}]$ ), ${ }^{13} \mathrm{C}$ NMR
(the $\alpha$-carbon at 70.0 ppm and the carbonyl carbon at 201.1 ppm ), IR (medium at $1697 \mathrm{~cm}^{-1}$ ), low resolution MS $\left(424\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$and high-resolution MS $\left(424.0576\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$.

## Scheme 5.21

These data confirm the structure of ketone 457, and, importantly, the success of the overall synthesis towards this ketone 457. It was difficult to show whether the ring-opening reaction generated the desired $\beta$-amino alcohol 458 or its regioisomer 519. The carbonyl group of the corresponding ketone shows a difference between the two isomers, confirming the structure as the ketone 457.

Figure 5.4

According to similar ketones, reported by Kasai ${ }^{91 \mathrm{a}}$ and Najera, ${ }^{91 \mathrm{~b}}$ these IR spectra provide promising results comparing to our data, which are similar to the ketone 521 as shown below.

$520^{15 \mathrm{a}}$
$1730 \mathrm{~cm}^{-1}$

$521^{15 b}$
$1680 \mathrm{~cm}^{-1}$

457
$1697 \mathrm{~cm}^{-1}$

Table 5.1: $\mathbf{C}=\mathbf{O}$ stretching of amino ketones

The ketone 521 contains an aromatic substitute $\alpha$ to the carbonyl group, similar to the ketone 457 (Table 5.1). Later, we obtained of X-ray crystallographic analysis data (Appendix, p.269272), which confirmed the structure of the ketone 457 (Figure 5.5).

Figure 5.5: X-ray Analysis of 1-(o-Bromophenyl)-3,3-dimethyl-2-(tosylamino)-butanone 457

The completion of the synthesis of the key intermediate $\mathbf{4 5 6}$ required only an apparently straightforward acetylene addition (Section 2.2.2, Scheme 2.16). Ketone 457 was first treated with five equivalents of lithium acetylide-ethylenediamine 295 in anhydrous dimethyl sulfoxide at room temperature for 16 hours (Scheme 5.22).

457

85\%

522

Scheme 5.22

Surprisingly, a $\beta$-amino alcohol 522 was isolated in $85 \%$ as a single diastereoisomer. The ${ }^{1} \mathrm{H}$ NMR spectrum of the amino alcohol $\mathbf{5 2 2}$ showed the resonance for the proton $\beta$ to the hydroxy group at 4.53 ppm as a double doublet $(J=9.8$ and 1.8 Hz , coupling with a proton of NH and long-range coupling with the hydroxy group) and two protons of the methylsulphinyl methyl group at 3.21 and 4.09 ppm as doublets ( $J_{A B}=13.4 \mathrm{~Hz}$ ). This was further confirmed
by ${ }^{13} \mathrm{C}$ NMR (the $\alpha$-carbon at 65.1 ppm and quarternary carbon at 37.8 ppm ), IR (broad at $\left.3267 \mathrm{~cm}^{-1}\right)$, low resolution MS (502 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$and high-resolution MS (502.0719 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$.

In this case, the lithium acetylide is likely to have deprotonated the dimethyl sulfoxide, deriving another nucleophilic species $\left[\mathrm{CH}_{3} \mathrm{~S}(\mathrm{O}) \mathrm{CH}_{2} \mathrm{Li}^{+}\right]$, which competes successfully with the lithium acetylide. It has been suggested that complex 295 has difficulty attacking the carbonyl group due to the highly bulky substitutents ( $o$-bromphenyl, tosyl, and $t$-butyl groups) of ketone 457. On other hand, lithium methylsulphinyl methylide is smaller and this is able to attack the ketone 457.

The addition of ethynylmagnesium bromide to the carbonyl fortunately afforded the $\beta$-amino alcohol 456 in $52 \%$ yield (Scheme 5.23). The ${ }^{1} \mathrm{H}$ NMR spectrum of 456 showed the resonance for the $\beta$-proton to the hydroxyl group at 4.64 ppm as a doublet $(J=9.8 \mathrm{~Hz})$ and the proton of the alkyne at 3.09 ppm as a singlet. This was confirmed by ${ }^{13} \mathrm{C}$ NMR (a quaternary carbon at 37.6 ppm and the $\beta$-carbon at 65 ppm ), IR (broad at $3486 \mathrm{~cm}^{-1}$ ), low resolution MS (432 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)-\mathrm{H}_{2} \mathrm{O}\right]^{+}\right)$and high-resolution MS $\left(467.1004\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{NH}_{4}\right]^{+}\right)$.

Scheme 5.23

A key step in the synthesis of the pyrrole $\mathbf{4 5 5}$ is the silver-mediated cyclization (see Section 1.4). The intermediate 456 was dissolved in anhydrous dichloromethane to which was added one equivalent of $10 \% \mathrm{wt} / \mathrm{wt}$ silver(I) nitrate on silica and the mixture was stirred vigorously in the dark at room temperature for 16 hours (Scheme 5.24). After removal of the catalyst by filtration and evaporation of the ether, the desired pyrrole 523 was obtained in $65 \%$ yield. The intermediate $\mathbf{4 5 6}$ could also be treated with 0.5 equivalent of $10 \% \mathrm{wt} / \mathrm{wt}$ silver(I) nitrate on silica, but the reaction required 36 hours to achieve a good yield.

Scheme 5.24

The ${ }^{1} \mathrm{H}$ NMR spectrum of the pyrrole 508 showed the resonances for the 4 -and 5 -pyrrole protons at 5.95 and 7.40 ppm respectively as a pair of doublets ( $J=3.5 \mathrm{~Hz}$ ). This was confirmed by ${ }^{13} \mathrm{C}$ NMR (CH-pyrrole at 114.7 and 128.7 ppm ), IR, low resolution MS (432 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$and high-resolution MS (432.0629 $\left.\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}\right)$.

### 5.3.4 Carbon-nitrogen bond formation

An important task remaining is the amination of the aryl halide, a key $\mathrm{C}-\mathrm{N}$ bond-forming process. Arylamines are attractive targets for chemical synthesis because of their prevalence and wide utility. They are found in many biologically active compounds such as our target molecule, rhazinilam, and are also employed as ligands for transition metals, ${ }^{92 a}$ and other electronically interesting materials. ${ }^{92 \mathrm{~b}}$ Traditional routes for the synthesis of these compounds such as electrophilic nitration and subsequent reduction, nucleophilic aromatic substitution, and Ullmann-type couplings often suffer from relatively harsh conditions and limited generality. ${ }^{92 \mathrm{c}}$

Scheme 5.25

In 1997, Buchwald demonstrated the utility of employing benzophenone imine 525 as a substitute for ammonia in the palladium-catalyzed amination of aryl halides and triflates (Scheme 5.25). ${ }^{93 a}$ The coupling and subsequent deprotections proceed in uniformly high yields.

Buchwald also reported a fairly smooth copper-catalyzed coupling reaction. ${ }^{93 b}$ Coppercatalyzed $N$-arylation of imidazole could be completed using $\mathrm{Cu}(\mathrm{OTf})_{2}$.benzene as a catalyst precursor and $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ as a base in xylene at $110^{\circ} \mathrm{C} \sim 120^{\circ} \mathrm{C}$ (Scheme 5.26). The addition of 1,10-phenanthroline (phen) and trans, trans-dibenzylideneacetone (dba) was crucial to the success of the process. The authors assumed that dba prevented undesirable disproportionation or in some way stabilized the catalytically active copper(I) species, but the effects of 1,10 -phenanthroline were unclear.

Scheme 5.26

This finding led to the examination of the efficiency of other chelating nitrogen ligands in copper-catalyzed C-N bond forming process. Buchwald recently reported an enhanced version of the Goldberg reaction-the copper-catalyzed amidation of aryl and heteroaryl halides. ${ }^{93 \mathrm{c}}$ The combination of air stable CuI and 1,2-diamine ligands in the presence of $\mathrm{K}_{3} \mathrm{PO}_{4}, \mathrm{~K}_{2} \mathrm{CO}_{3}$ or $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ comprised an extremely efficient and general catalytic system for N -amidation of aryl and heteroaryl iodides and bromides and in some cases even unactivited aryl chlorides (scheme 5.27).

## Scheme 5.27

The reaction is tolerant of a variety of functional groups. The degree of substitution and consequently the steric bulk of the diamine ligands played the most important role. $N, N$ 'dimethylethylenediamine and trans- $N, N$ '-dimethyl-1,2-cyclohexanediamine gave the best results. Strong base impedes the desired aryl amidation reaction via formation of unreactive cuprate complexes (Scheme 5.28). The $\mathrm{p} K_{\mathrm{HA}}$ of the base employed in the arylation reaction should be below the $\mathrm{p} K_{\mathrm{HA}}$ of the amide substrate.

Scheme 5.28

O-Donor ligands can also be used in $\mathrm{C}-\mathrm{N}$ bond forming reactions. Buchwald reported a mild, practical Cu-catalyzed amination of functionalized aryl iodides (scheme 5.29). ${ }^{93 \mathrm{~d}}$ This simple $\mathrm{C}-\mathrm{N}$ bond-forming protocol used CuI as the catalyst and ethylene glycol as the ligand in 2propanol. The reactions could be performed without protection from air or moisture. Keto, cyano, nitro, amino, carboxylate, methoxy, bromo and chloro groups were tolerant on the aryl iodide component. No significant electronic effects were observed for para- and metasubstituted aryl iodides.

Scheme 5.29

However, more work still needs to be done to find new ligands and to expand the scope of the substrates and reactions that may be catalyzed by copper species. Twieg also reported an alternative solvent, 2-N,N-dimethylaminoethanol, and copper metal as a useful catalyst precursors for the amination of aromatic halides. ${ }^{93 e}$ The combination of metallic copper catalyst with $\mathrm{K}_{3} \mathrm{PO}_{4} . \mathrm{H}_{2} \mathrm{O}$ often affords the best results (Scheme 5.30).

Scheme 5.30

Unfortunately, following the application of both the palladium-catalyzed and coppercatalyzed aminations by Buchwald, ${ }^{93 a, c}$ and the copper-catalyzed amination by Twieg, ${ }^{93 \mathrm{e}}$ we have not been able to convert 3-(o-bromophenyl)-pyrrole 523 into the desired 3-(o-aniline)pyrrole 455. All crude reaction mixtures have been tested by low-resolution MS and showed mainly the starting material 523. However, the model study discussed in this chapter reaffirms the utility of the aziridination process for the construction of the 3-(o-bromophenyl)-2-t-butylpyrrole 523 frameworks. Due to time constraints, the desired pyrrole $\mathbf{4 5 5}$ could unfortunately not be synthesized (Figure 5.6).

Figure 5.6

### 5.4 Retrosynthetic Analysis and strategy

According to the retrosynthetic study of Rhazinilam 324, disconnection of the amide functionality would lead to the pyrrole 536. To obtain the pyrrole 536, silver-mediated cyclization would apply to $\alpha$-amino alcohol 537 , only if the aziridination could be applied successfully to an imine 538 (Scheme 5.31).

## Scheme 5.31

Since one important objective of the synthetic work was to establish the precise structure of the molecule, it is necessary to design a flexible strategy allowing for the eventual formation of all possible stereoisomers. The logic for our design was based on the retrosynthetic analysis of the imine $\mathbf{5 3 8}$ shown in Scheme 5.32. It was anticipated that C-2 in structure $\mathbf{5 3 9}$ could be stereoselectively introduced in a fragmentation ${ }^{94}$ of the lactone 541, thereby establishing the necessary single stereogenic center and two side chains which could be independently manipulated.

Scheme 5.32

The forward transformation, stereoselective synthesis of lactone 543 from $L$-glutamic acid 545, is well documented in the literature. ${ }^{95}$ A potential advantage of this strategy is that it leads to the establishment of all structural elements of the nine-membered lactam B-ring, the piperidine D-ring and ethyl group in Rhazinilam 324. We will observe the absolute stereochemistry of the molecules from their specific rotation; the ability of chiral molecules to rotate plane-polarized light. It is a function of structure (chirality), concentration, temperature, path length and wavelength, as shown in the formula below.

$$
\begin{aligned}
& {[\alpha]_{\mathrm{D}}=\alpha / \mathrm{lc}} \\
& \alpha=\text { observed rotation } \\
& \mathrm{l}=\text { cell length } \\
& \mathrm{c}=\text { concentration }(\mathrm{g} / 100 \mathrm{~mL}) \\
& \mathrm{D}=\text { wavelength, sodium } \mathrm{D} \text {-line }(656 \mathrm{~nm})
\end{aligned}
$$

### 5.4.1 The synthesis of (S)- $\gamma$-hydroxymethyl- $\gamma$-butyrolactone $544^{95 \mathrm{a}}$

(S)- $\gamma$-Hydroxymethyl- $\gamma$-butyrolactone 544 has been successfully used as a chiral synthon toward the asymmetric total synthesis ofa number of natural products. ${ }^{95 \mathrm{~b}}$ It is highly desirable to use a suitably constructed and optically active compound as a starting material, thereby avoiding a resolution step later in the synthesis. Yamada and co-workers reported a synthesis of the important intermediate 546 of $D$-ribose 547 from $L$-glutamic acid 545 as shown in Scheme 5.33 , by making use of the chiral center present in $\mathbf{5 4 5} .{ }^{95 a}$

L-Glutamic acid, 545

Scheme 5.33

The key feature of the nitrous acid deamination of $\mathbf{5 4 5}$ is that it gives only the substitution product 548, which proceeds with full retention of configuration due to the participation of the neighbouring $\alpha$-carboxylate group. Selective reduction of the ester group in (S) $\boldsymbol{\gamma}$ -ethoxycarbonyl- $\gamma$-butyrolactone 549 to (S)- $\gamma$-hydroxymethyl- $\gamma$-butyrolactone 544 may be reliably performed using sodium borohydride. ${ }^{95 a}$

Thus, $L$-glutamic acid 545 was converted into the enantiomerically pure $\gamma$-butyrolactone 544 via three literature steps (Scheme 5.34). ${ }^{95 a}$ Nitrous acid deamination of $\mathbf{5 4 5}$ in aqueous solution gave the lactone acid 548, which was converted into the corresponding lactone ester 549 in $79 \%$ yield. Reduction of 549 with sodium borohydride in ethanol at room temperature afforded $\gamma$-butyrolactone 544 in $89 \%$ yield. IR absorptions at 3384 and $1767 \mathrm{~cm}^{-1}$ indicated the presence of the hydroxy and $\gamma$-lactone functions respectively.

Any protecting group for the hydroxy function in $\mathbf{5 4 4}$ must be stable under both reduction (reductive opening of the lactone ring with Zn dust) and alkaline (alkylation) conditions. Tanano ${ }^{19 b}$ and Koga ${ }^{96 a}$ observed that in the alkylation reaction, the very large trityl group consistently directs the approach of the incoming group to the opposite side; consequently, the stereochemistry of the newly generated chiral center may be arbitrarily controlled merely by changing the alkylation sequence.

Scheme 5.34

Treatment of lactone 544 with triphenylmethyl chloride in pyridine at room temperature gave (S)-trityloxymethyl- $\gamma$-butyrolactone 550 in $60 \%$ yield with $[\alpha]_{\mathrm{D}}+26.7^{\circ}\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right)$, which is almost identical to that observed by Takano ${ }^{97 \mathrm{a}}\left\{[\alpha]_{\mathrm{D}}+28.6^{\circ}\right.$ (Scheme 5.35$\left.)\right\}$.

Scheme 5.35

Brückner also reported the similar transformation by using tert-butyldiphenylsilyl as the protecting group. ${ }^{96 b}$ Silylation ${ }^{97 b}$ of the hydroxy group in 544 with tert-butyldiphenylsilyl chloride under standard conditions (triethylamine, 1.1 equiv. of TBDPSCl, and catalytic amount of DMAP in DCM) gave ( $S$ ) - $t$-butyldiphenylsilyl- $\gamma$-butyrolactone 551 in $70 \%$ yield with $[\alpha]_{\mathrm{D}}+24.95^{\circ}\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right)$ (Scheme 5.35).

### 5.4.2 Synthesis of Chiral Quaternary Carbon (C-3)

Following from Takano's work, ${ }^{95 b}$ treatment of the trityloxymethyl- $\gamma$-butyrolactone 550 with LDA and allyl bromide in tetrahydrofuran, affords the allyl-lactone 552 in $96 \%$ yield (Scheme 5.36).

Scheme 5.36

The allyl-lactone 552 was treated again with LDA to generate the enolate 553 , which on alkylation with ethyl bromide anti to the trityloxy group regernerated the chiral center to produce the lactone 554 in $90 \%$ yield. Hydroboration of the lactone 554 with dicyclohexylborane then selectively generated the primary alcohol 555 in $81 \%$ yield (Scheme 5.37). Silylation of the new hydroxy group with tert-butyldimethylsilyl chloride under standard condition gives the desired silyl ether 556.

## Scheme 5.37

Detritylation of the lactone 556 in methanol containing a trace of hydrochloric acid for 5 hours at room temperature gave an undesired product, the hydroxylactone 557, caused by loss of the silyl group (Scheme 5.38).

Scheme 5.38

To prevent losing this protecting group on the hydroxypropyl side chain under the detritylation conditions, the primary alcohol 555 was treated with the trichloroacetimidate 440 and boron trifluoride etherate in $\mathrm{DCM} /$ cyclohexane to give $p$-methoxybenzyloxy ether 558 in $60 \%$ yield (Scheme 5.39).

Scheme 5.39

Although this route proceeded in good yield, we attempted to introduce the PMB propanol directly to C-3, which would remove two subsequent steps (hydroboration and protection of the generated hydroxyl). Through some straightforward functional group manipulations, PMB propyl iodide 562 was prepared from 1,3-propanediol $559^{98 a}$ (PMB protection, mesylation, and iodination) or bromopropanol $560^{\mathbf{9 8 b}}$ (PMB protection and iodination).

Scheme 5.40

Treatment of readily available bromopropanol 560 with the trichloroacetimidate 440 and a catalytic amount of camphorsulfonic acid in DCM/cyclohexane gave p-methoxybenzyloxy propyl bromide 561 in $99 \%$ yield (Scheme 5.40). Treatment of the bromide 561 with sodium iodide in refluxing acetone resulted the PMB propyl iodide 562 in $82 \%$ yield (Scheme 5.40).

The critical stage of the present synthesis is the alkylation of the lactone 543 with the iodide 562. Due to facile deprotection of the silyl group, the lactone 551 was tested in this sequential dialkylation. Optimization of the alkylation of 551 makes use of Koga's procedure ${ }^{95 a}$ giving the desired lactone 563 in a satisfactory yield ( $62 \%$ isolated yield) when the reaction was carried out at $-25^{\circ} \mathrm{C}$ for 3 hours, and then at room temperature for 16 hours (Scheme 5.41).

Scheme 5.41

The ${ }^{1} \mathrm{H}$ NMR spectrum of the lactone 563 shows the characteristic resonance for the proton $\mathrm{H}-3$ at $3.37-3.41 \mathrm{ppm}$ as a multiplet and the proton $\mathrm{H}-5$ at 4.41-4.45 ppm as a double doublet. The structure of $\mathbf{5 6 3}$ was also confirmed by ${ }^{13} \mathrm{C}$ NMR (carbon C-3 and C-5 at 39.4 and 77.8 ppm respectively), IR (strong at $1769 \mathrm{~cm}^{-1}$ ), low resolution MS (533 $[\mathrm{M}+\mathrm{H}]^{+}$) and highresolution MS (533.2723 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.

Scheme 5.42

The lactone enolate derived from 563 is treated at $-25^{\circ} \mathrm{C}$ with iodoethane in the presence of DMPU to furnish the lactone 564 having a quanternary carbon at $\mathrm{C}-3$ (Scheme 5.42). In its spectral data, the crude lactone 564 shows the characteristic resonance corresponding to the carbon C-3 at 47.8 ppm , low resolution MS ( $561[\mathrm{M}+\mathrm{H}]^{+}$), high-resolution MS (561.3031 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$, and $[\alpha]_{\mathrm{D}}+14.5^{\circ}\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right)$, which indicates the desired configuration when compared to the lactone 558 with $[\alpha]_{\mathrm{D}}+16.1^{\circ}\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right)$.

Further, ${ }^{1} \mathrm{H}$ NMR indicated only very low levels at most of any diastereoisomer. All attempts to carry out both alkylations in one flask failed, however.

### 5.4.3 Reducetive opening of the lactone ring

The final drive towards the target imine $\mathbf{5 2 8}$ proceeded as follows. The silyl group in $\mathbf{5 6 4}$ was removed using fluoride ions and the resulting hydroxylactone 565 was converted into the corresponding iodide 566 (40\% overall yield, Scheme 5.43).

## Scheme 5.43

The formation of these three lactones is confirmed by ${ }^{1} \mathrm{H}$ NMR analysis (Table 5.1). The signal corresponding to both $\mathrm{CH}_{2} \mathrm{~S}$ at position 4 and 1 ' in lactone $\mathbf{5 6 4}$ are rather complicated, due to their enantiotopic nature. However, after desilylation, both $\mathrm{CH}_{2} \mathrm{~s}$ of the alcohol $\mathbf{5 6 5}$ appear clearly as four double doublets, likewise in the iodide 566 , but the protons of $\mathrm{CH}_{2}-1$, in 566 are shifted downfield with a difference of $0.32-0.4 \mathrm{ppm}$ from the alcohol 565.

| Compound | $[\alpha]_{\mathrm{D}}$ <br> $\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right)$ | $\mathrm{CH}_{2}-4, J$ <br> $(\mathrm{ppm}, \mathrm{Hz})$ | $\mathrm{CH}_{2}-1$ <br> $(\mathrm{ppm}, \mathrm{Hz})$ | $\mathrm{C}-3$ <br> $(\mathrm{ppm})$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{5 6 4}$ | $+14.5^{\circ}$ | $1.78-1.84(\mathrm{~m})$ | $3.55(\mathrm{dd}, 11.4,4.4)$ | 47.8 |
|  |  | $2.01-2.10(\mathrm{~m})$ | $3.61-3.68(\mathrm{~m})$ |  |
|  |  |  |  |  |
| $\mathbf{5 6 5}$ | $+15.4^{\circ}$ | $1.90(\mathrm{dd}, 13.1,8.3)$ | $3.46(\mathrm{dd}, 12.5,4.1)$ | 47.9 |
|  |  | $1.99(\mathrm{dd}, 13.1,8.3)$ | $3.73(\mathrm{dd}, 12.5,4.1)$ |  |
|  |  |  |  |  |
| $\mathbf{5 6 6}$ | $-16.8^{\circ}$ | $1.80(\mathrm{dd}, 13.3,7.9)$ | $3.14(\mathrm{dd}, 10.1,6.2)$ | 48.8 |
|  |  | $2.20(\mathrm{dd}, 13.3,7.9)$ | $3.33(\mathrm{dd}, 10.1,6.2)$ |  |
|  |  |  |  |  |

Table 5.1: data for the lactones 564, 565 and 566

Another critical stage in the synthesis of the imine 539 had been reached. As hoped, application of Florent's procedure ${ }^{94}$ to the lactone 566 using non-preactivated zinc in THF/HOAc as solvent afforded the unsaturated carboxylic acid 567 (Scheme 5.44).

## Scheme 5.44

Analysis of the IR spectrum showed the disappearance of the lactone carbonyl absorption at $1750 \mathrm{~cm}^{-1}$ and the appearance of acid absorption at 1696 and $3657 \mathrm{~cm}^{-1}$. Specific rotation ( $[\alpha]_{\mathrm{D}}-3.7^{\circ}$ ) confirms the $2 S$-configuration of the acid 567 .

569

Scheme 5.45

The completion of the synthesis of the imine 539 then required only a few straightforward functional group manipulations. Thus, reduction of the carboxylic acid in 567 with lithium aluminium hydride provided in quantitative yield a primary alcohol 568 which was oxidized to aldehyde 569 by PCC (Scheme 5.45). The signal for the quaternary carbon (C-2) in 568 was shifted downfield with a difference of 8.9 ppm from that in the acid 567 , and is then shifted back to a higher field with a difference of 11.8 ppm when the aldehyde carbonyl in 569 has formed.

The retrosynthetic analysis outlined in Scheme 5.31 identified imine 539 as a potential synthetic intermediate: the construction of this compound would make the achievement of the synthetic objective, for it would permit an evaluation of the crucial aziridination. Treatment of
the aldehyde 569 with $p$-toluenesulfonamide monohydrate, $4^{\circ} \mathrm{A}$ molecular sieve and catalytic amount of boron trifluoride etherate in toluene under reflux for 16 hours did not give the desired imine 570 in reasonable yield (10-30\%). ${ }^{85}$ It was gratifying to find that imine formation had been conducted smoothly by Trost and Marrs. ${ }^{99}$ These authors suggested that the mechanism of this particular reaction involves a cycloaddition to give a four-membered ring 573, followed by cyclo-reversion to generate the desired product (Figure 5.7).

Figure 5.7

Exposure of the aldehyde 569 to the action of chloramine-T in the presence of tellurium powder in refluxing toluene provided the imine 570 in essentially quantitative yield (Scheme 5.46). Analysis of the IR spectrum showed the disappearance of the aldehyde carbonyl absorption at $1722 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{5 7 0}$ showed the characteristic resonance for a proton of an imine at 8.33 ppm as a singlet, which was also confirmed by ${ }^{13} \mathrm{C}$ NMR (the carbon of the imine at 185.6 ppm ), low resolution MS (444 [M+H] ${ }^{+}$) and high-resolution MS (444.2202 [M+H] ${ }^{+}$).

Scheme 5.46

### 5.5 Aziridination of the imine 570

At first glance, the imine $\mathbf{5 7 0}$ might appear to be well suited for the crucial aziridination step, ${ }^{81 \mathrm{~b}}$ it possesses an electrophilic moiety. However, reaction of the tosylhydrazone sodium salt 496 with the imine 570 in the presence of a catalytic amount of rhodium acetate, $\mathrm{BnEt}_{3} \mathrm{~N}^{+} \mathrm{Cl}^{-}$, and tetrahydrothiophene in dioxane at $60^{\circ} \mathrm{C}$ provided none of the desired
aziridine 574 (Scheme 5.47). It was deduced that the double bond in $\mathbf{5 7 0}$ should be masked in order to enhance the possibility of this reaction taking place.

Scheme 5.47

Hydroboration of the double bond appeared reasonable because it would allow construction of the seemingly optimum imine 538. This could be achieved by protection of the acid 567 as a methyl ester, followed by hydroboration of the existing double bond to give a primary alcohol 576, and protecting the alcohol in 576 to give the methyl ester 577 , which would be ready to reduce to an aldehyde 578 and form the imine 538 (Scheme 5.48).

Scheme 5.48

Treatment of the acid 567 with potassium carbonate and methyl iodide in acetone resulted in the formation of methyl ester 575 in quantitative yield (Scheme 5.49). ${ }^{100}$ The ${ }^{1} \mathrm{H}$ NMR spectrum of 575 showed the characteristic resonance for the three protons of the methoxyl group at 3.57 ppm as a singlet, and this was also confirmed by ${ }^{13} \mathrm{C}$ NMR (the quaternary carbon at 49.4 ppm$)$, low resolution MS (321 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$and high-resolution MS
$\left(321.2058[\mathrm{M}+\mathrm{H}]^{+}\right)$. Unfortunately, during the hydroboration process, the methoxy group in 575 is also deprotected to give the unwanted acid 579 (Scheme 5.49). Due to time constraints, our research program had to finish at this stage.

1) borane-methyl sulphide complex,
cyclohexene, THF, $0^{\circ} \mathrm{C}$ to rt , 1 h
2) $\mathrm{EtOH} / \mathrm{aq} . \mathrm{NaOH} / 35 \% \mathrm{H}_{2} \mathrm{O}_{2}$, $0^{\circ} \mathrm{C}$, then $50^{\circ} \mathrm{C}, 1 \mathrm{~h}$
3) $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}, \mathrm{NaOH}$, reflux, 1 h
4) acetic acid 94\%

579

Scheme 5.49

### 5.6 Conclusion

The silver-mediated cyclization emerged as perhaps a useful method for pyrrole formation, allowing the incorporation of highly hindered substituents at positions 2 and 3. Keys steps within our target synthesis were the application of the imine 478 to aziridination reactions and the ring opening of aziridine 459 to form the corresponding $\beta$-amino alcohol 458. Unfortunately, this technology failed to provide the desired pyrrole $\mathbf{4 5 5}$ by amination. Finally, although it was not possible to form the corresponding aziridine, the synthesis of the imine 570 emphasized the difficulties encountered and often overcome in this important area of the total synthesis of (-)-rhazinilam 283.

## Chapter 6

## Experimental

### 6.1 General Details

All non-aqueous reaction, unless otherwise stated, were conducted in oven or flame-dried apparatus under an atmosphere of dry nitrogen with magnetic stirring. Low temperatures were obtained using solid carbon dioxide and an acetone bath $\left(-78^{\circ} \mathrm{C}\right)$ or an ice-water bath $\left(0^{\circ} \mathrm{C}\right)$. Heated reactions were conducted in a stirred oil bath heated on a magnetically stirred hotplate. All microwave reaction were conducted in a Discover Benchmate, microwave synthesis system.

Solvents were dried and purified prior to use, where necessary. Tetrahydrofuran and diethyl ether was distilled from sodium benzophenone ketyl. $N, N$-Dimethylformamide, triethylamine, dichloromethane and acetonitrile were dried over $4^{\circ} \mathrm{A}$ molecular sieves. Toluene, pyridine and diisopropylamine were dried over and distilled from potassium hydroxide. Ether was distilled from sodium benzophenone ketyl. All solutions of crude products were dried by brief exposure to anhydrous magnesium sulphate $\left(\mathrm{MgSO}_{4}\right)$, unless otherwise stated, then filtered and evaporated under reduced pressure (Buchi rotary evaporator under water pump pressure and a warm water bath). Column chromatography was carried out on Merk silica gel 60 (230400 mesh) as the stationary phase, in association with the $\mathrm{R}_{\mathrm{f}}$ values quoted using the solvents stated. All reactions were monitored by tlc using Merck silica gel $60 \mathrm{~F}_{254}$ precoated aluminium backed plates that were visualised with ultraviolet light, potassium permanganate or ammonium molybdenate. Retention factor values $\left(\mathrm{R}_{\mathrm{f}}\right)$ are reported in the appropriate solvent system.

All melting points ( $\mathrm{mp}{ }^{\circ} \mathrm{C}$ ) were determined on a Kofler hot-stage apparatus. All boiling points (bp ${ }^{\circ} \mathrm{C}$ ) were determined by bulb-to-bulb distillation using a Buchi GKR-51 kugelrohr distillation apparatus. Melting and boiling points are uncorrected. Infrared spectra were obtained using a Perkin Elmer 1600 series Fourier Transform Infra-red Spectrometer, as liquid films on sodium chloride plates [film], as a solution in dichloromethane $\left[\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ ] or as nujol mulls on sodium chloride plates [nujol]. The signals are described by the following abbreviations: strong (s), medium (m) weak (w) and broad (br). Specific rotations $[\alpha]_{D}$ were determined on a AA-1000 polarimeter with millidegree-auto-ranging observing at room temperature.

Proton ( ${ }^{1}$ H) NMR spectra were recorded on a Bruker DPX 400 instrument at 400 MHz , as dilute solutions in deuteriochloroform at 298 K . The abbreviations $\delta_{\mathrm{H}}$ and $\delta_{\mathrm{C}}$ denote ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data respectively. The chemical shifts are recorded relative to residual chloroform ( 7.27 ppm ) as an internal standard. The following abbreviations are used throught: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ unresolved multiplet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{td}=$ triplet of doublets, br s = broad singlet, app td = apparent triplet of doublets etc. All coupling constants $(J)$ are recorded in Hertz $(\mathrm{Hz})$. Carbon $\left({ }^{13} \mathrm{C}\right)$ NMR spectra were recorded on the same instrument and conditions, but operating at 100.6 MHz . Chemical shifts are reported relative to residual chloroform ( 77.0 ppm ) as an internal standard in a broad band decoupled mode. Assignments were made on the basis of chemical shift and coupling constant data using DEPT-135 and COSY experiments where required.

Low resolution mass spectra were recorded on a Fisons VG Platform Quadrapole Mass Spectrometer using atmospheric pressure chemical ionisation [APcI]. $M / z$ values are reported with the percentage abundance in parentheses, only for peaks with intensities of $10 \%$ or greater. Accurate high-resolution mass spectrometric data were determined by the EPSRC Mass Spectrometry Service centre at University College Swansea and the molecular formula corresponds to the observed signal using the most abundant isotopes of each element. All molecular formulae are quoted for molecular + hydrogen $[\mathrm{M}+\mathrm{H}]^{+}$, molecular + ammonium ion $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$or molecular + sodium ion $[\mathrm{M}+\mathrm{Na}]^{+}$. Microanalytical data were obtained on a Perkin Elmer Elemental 2400 CHN elemental analyser and are quoted as atom percentages. X-ray crystal structures were determined by Dr K. M. A. Malik amd Dr M. P. Coogan, Cardiff University.

### 6.2 Experimental

## Methyl (4-methylphenylsulfonylamino)-acetate $154{ }^{101}$

Glycine methyl ester hydrochloride ( $5.0 \mathrm{~g}, 39.82 \mathrm{mmol}$ ) and $p$-toluenesulfonyl chloride $(8.35$ $\mathrm{g}, 43.8 \mathrm{mmol}$ ) were placed in a dried round bottom flask and partially dissolved in 100 mL of dried dichloromethane. After adding 4-dimethylaminopyridine ( $0.97 \mathrm{~g}, 7.96 \mathrm{mmol}$ ), the mixture was cooled to $0^{\circ} \mathrm{C}$ and triethylamine ( $11.1 \mathrm{~mL}, 79.64 \mathrm{mmol}$ ) was added dropwise.

The resulting mixture was allowed to stir for 30 min at $0^{\circ} \mathrm{C}$, then left to stir at room temperature overnight. After 18 h , the mixture was diluted with dichloromethane ( 25 mL ) then washed with 25 mL of 2 M HCl . The organic layer was further washed with water ( 100 $\mathrm{mL})$ and brine $(100 \mathrm{~mL})$, then dried and evaporated. When the crude product $(10.89 \mathrm{~g})$ was completely dry, it was recrystallized from petroleum ether $40-60^{\circ} \mathrm{C}$, diethyl ether and dichloromethane in the water bath $\left(80^{\circ} \mathrm{C}\right)$, followed by strorage at $0^{\circ} \mathrm{C}$ overnight. The precipitate was filtrated and washed with ice-cold diethyl ether. The dried product was a colourless crystalline solid, N-tosyl glycine ester $154(6.46 \mathrm{~g}, 67 \%), \mathrm{mp} 92-93^{\circ} \mathrm{C}$ [lit. mp ${ }^{101}$ $92-93^{\circ} \mathrm{C}$ ]; $\nu_{\max } / \mathrm{cm}^{-1}$ [nujol] $3276(\mathrm{~s}), 1729(\mathrm{~s}), 1352(\mathrm{~s}), 1162(\mathrm{~s})$ and $811(\mathrm{w}) ; \delta_{\mathrm{H}} 2.26(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 3.47\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.62\left(2 \mathrm{H}, \mathrm{d}, J 5.2,2-\mathrm{CH}_{2}\right), 4.92(1 \mathrm{H}, \mathrm{t}, J 5.2, \mathrm{NH}), 7.15(2 \mathrm{H}, \mathrm{d}, J$ $8.0,2 \times \mathrm{ArH})$ and $7.58(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 22.2\left(\mathrm{ArCH}_{3}\right), 44.4\left(2-\mathrm{CH}_{2}\right), 53.0\left(\mathrm{OCH}_{3}\right)$, 127.7 ( $2 \times \mathrm{ArCH}$ ), 129.3 ( $2 \times \mathrm{ArCH}$ ), 144.3, 147.2 ( $2 \times \mathrm{ArC}$ ) and 170 ( $\mathrm{C}=\mathrm{O}$ ); $m / z$ [ APcI$] 244$ $\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 198$ (25), 184 (50), 155 (40), 102 (20); Anal. Calcd for $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{4} \mathrm{~S}: \mathrm{C}$, 49.32; H, $5.34 ; \mathrm{N}, 5.75$. Found: C, 49.02; H, $5.37 ; \mathrm{N}, 5.68 \%$. These data are consistent with those recorded in the literature. ${ }^{101}$

## 1-(tert-Butyldimethylsilyloxy)-pent-4-yne $229^{\text {102a }}$

To a stirred solution of 4-pentyn-1-ol $225(4.40 \mathrm{~mL}, 48 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 100 mL ) was added imidazole ( $3.92 \mathrm{~g}, 57 \mathrm{mmol}$ ). After a clear solution was obtained, tertbutyldimethylsilyl chloride $(8.70 \mathrm{~g}, 57 \mathrm{mmol})$ was added to give a cloudy white solution. The mixture was allowed to stir for 16 h at room temperature, then quenched with water ( 100 mL ) and diluted with dichloromethane $(50 \mathrm{~mL})$. The organic layer was separated and washed with brine ( 100 mL ). The organic layer was then dried and the solution evaporated to give the ynyloxy-silane 229 as a light yellow oil ( $9.40 \mathrm{~g}, 100 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3313 (m), 2954 (s), $2859(\mathrm{~m}), 2112(\mathrm{w}), 1472(\mathrm{w}), 1257(\mathrm{~s}), 1103(\mathrm{~s}), 835(\mathrm{~s})$ and $776(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.00(6 \mathrm{H}, \mathrm{s}, 2 \mathrm{x}$ $\left.\mathrm{SiCH}_{3}\right), 0.83\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.67\left(2 \mathrm{H}\right.$, pen, $\left.J 6.5,2 \mathrm{CH}_{2}\right), 1.87(1 \mathrm{H}, \mathrm{t}, J 2.7,5-\mathrm{H}), 2.22(2 \mathrm{H}$, td, $\left.J 6.5,2.7,3-\mathrm{CH}_{2}\right)$ and $3.64\left(2 \mathrm{H}, \mathrm{t}, J 6.5,1-\mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}-5.3\left(2 \times \mathrm{SiCH}_{3}\right), 14.8\left(2-\mathrm{CH}_{2}\right), 18.3$ $(\mathrm{SiC}), 25.9\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 31.5\left(3-\mathrm{CH}_{2}\right), 61.42\left(1-\mathrm{CH}_{2}\right), 68.2(5-\mathrm{CH})$ and $84.2(4-\mathrm{C} \equiv)$. These data are consistent with those recorded in the literature. ${ }^{102 \mathrm{a}}$

## 1-(tert-Butyldimethylsiloxy)-hex-5-yne $231^{\text {102b }}$

Starting from 5-hexyn-1-ol 256 ( $5 \mathrm{~g}, 50 \mathrm{mmol}$ ) and using exactly the same method described in the foregoing experiment, the ynyloxy-silane 231 was obtained as a light yellow oil ( 10.6 g , $100 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3313 (m), 2929 (s), 2875 (m), 2122 (w), 1472 (m), 1255 (s), 1107 (s), $836(\mathrm{~s})$ and $776(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.54-1.60(4 \mathrm{H}, \mathrm{m}, 2-$ and $\left.3-\mathrm{CH}_{2}\right), 1.90(1 \mathrm{H}, \mathrm{t}, J 2.6,6-\mathrm{H}), 2.18\left(2 \mathrm{H}, \mathrm{td}, J 6.7,2.6,4-\mathrm{CH}_{2}\right)$ and $3.58(2 \mathrm{H}, \mathrm{t}, J 6.0,1-$ $\left.\mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}-5.3\left(2 \times \mathrm{SiCH}_{3}\right), 18.1\left(4-\mathrm{CH}_{2}\right), 18.3(\mathrm{SiC}), 24.9\left(3-\mathrm{CH}_{2}\right), 25.9\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 31.8(2-$ $\left.\mathrm{CH}_{2}\right), 62.6\left(1-\mathrm{CH}_{2}\right), 68.2(6-\mathrm{CH})$ and $84.5(5-\mathrm{C} \equiv)$. These data are consistent with those recorded in the literature. ${ }^{102 \mathrm{~b}}$

## General Procedure of the Preparation of Acetylene Aldehydes ${ }^{\text {103a }}$

To a stirred solution of the acetylene 123 ( $50 \mathrm{mmol}, 1 \mathrm{eq}$.) in anhydrous tetrahydrofuran ( 50 mL ) at $-40^{\circ} \mathrm{C}$ was added $n$-butyl lithium ( 20 mL of a 2.5 M solution in hexanes, $50 \mathrm{mmol}, 1$ eq.) dropwise and, when this addition was completed, anhydrous dimethylformamide ( 7.80 $\mathrm{mL}, 100 \mathrm{mmol}, 2$ eq.) was added in one portion. The mixture was then warmed to room temperature and stirred for 30 min then poured into a well-stirred mixture of $10 \%$ aqueous $\mathrm{KH}_{2} \mathrm{PO}_{4}$ ( $200 \mathrm{~mL}, 160 \mathrm{mmol}, 3.2 \mathrm{eq}$.) and diethyl ether ( 200 mL ) maintained at $5^{\circ} \mathrm{C}$ and the resulting mixture stirred vigorously for 10 min . The aqueous layer was separated and extracted with ether ( $2 \times 100 \mathrm{~mL}$ ), The combined organic solutions were then dried and evaporated to give the aldehyde 122, which was usually ready for further use.

## 3-Phenyl-2-propynal $224^{\text {103a }}$

Phenylacetylene $223(5.10 \mathrm{~g}, 50 \mathrm{mmol})$ in anhydrous tetrahydrofuran $(50 \mathrm{~mL})$ at $-40^{\circ} \mathrm{C}$ was reacted with $n$-butyl lithium ( 20 mL of a 2.5 M solution in hexanes, 50 mmol ) dropwise and anhydrous dimethylformamide $(7.80 \mathrm{~mL}, 100 \mathrm{mmol})$ according to the general procedure. Work-up yielded the aldehyde 224 as a yellow oil ( 6.5 g , ca. $100 \%$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2855 (w), 2182 (s), 1659 (s), 1483 (m), 1438 (m), 1388 (w), 1257 (w), 1022 (w), 946 (m), 755 (w) and $685(\mathrm{w}) ; \delta_{\mathrm{H}} 7.33(2 \mathrm{H}, \mathrm{dd}, J 7.7,7.4,2 \times \mathrm{ArH}), 7.41(1 \mathrm{H}, \mathrm{tt}, J 7.4,2.3, \mathrm{ArH}), 7.54(2 \mathrm{H}, \mathrm{dd}$, $J 7.7,2.3,2 \mathrm{x} \mathrm{ArH})$ and $9.36(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}} 88.8,95.5(\mathrm{C} \equiv \mathrm{C}), 119.8(\mathrm{ArC}), 129.1(2 \mathrm{x}$ $\mathrm{ArCH}), 131.7(\mathrm{ArCH}), 133.7(2 \mathrm{x} \mathrm{ArCH})$ and $177.2(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 131\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$. These data are consistent with those recorded in the literature. ${ }^{103 \mathrm{a}}$

## 2-Heptynal $226^{\text {103b }}$

1-Hexyne 225 ( $5.8 \mathrm{ml}, 50 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(50 \mathrm{~mL})$ at $-40^{\circ} \mathrm{C}$ was reacted with $n$-butyl lithium ( 20 mL of a 2.5 M solution in hexanes, 50 mmol ) dropwise and anhydrous dimethylformamide ( $7.80 \mathrm{~mL}, 100 \mathrm{mmol}$ ) according to the general procedure. Work-up yielded the aldehyde 226 as a light yellow oil ( 4.90 g , ca. $100 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] $2959(\mathrm{~s}), 2201(\mathrm{~s}), 1672(\mathrm{~s}), 1466(\mathrm{~m}), 1213(\mathrm{~m})$ and $1137(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.82\left(3 \mathrm{H}, \mathrm{t}, J 7.3, \mathrm{CH}_{3}\right)$, $1.35\left(2 \mathrm{H}\right.$, hex, $\left.J 7.3,6-\mathrm{CH}_{2}\right), 1.48\left(2 \mathrm{H}\right.$, pen, $\left.J 7.3,5-\mathrm{CH}_{2}\right), 2.32\left(2 \mathrm{H}, \mathrm{t}, J 7.3,4-\mathrm{CH}_{2}\right)$ and 9.07 $(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}} 13.1\left(\mathrm{CH}_{3}\right), 18.4,21.5,29.2\left(4-, 5-\right.$ and $\left.6-\mathrm{CH}_{2}\right), 81.3,98.7(\mathrm{C} \equiv \mathrm{C})$ and 176.7 $(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 111\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$. These data are consistent with those recorded in the literature. ${ }^{103 \mathrm{~b}}$

## 4-Dimethylpent-2-ynal $228{ }^{103 \mathrm{c}}$

3,3-Dimethyl-1-butyne 227 ( $5.0 \mathrm{~g}, 60 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 50 mL ) at $-40^{\circ} \mathrm{C}$ was reacted with $n$-butyl lithium ( 24 mL of a 2.5 M solution in hexanes, 60 mmol ) dropwise and anhydrous dimethylformamide $(9.36 \mathrm{~mL}, 120 \mathrm{mmol})$ according to the general procedure. Work-up yielded the aldehyde 228 as a light yellow oil ( 6.60 g , ca. $100 \%$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film]

2862 (s), 2770 (m), 2220 (w), 1685 (s), 1602 (w), 1518 (w), 1456 (m), 1364 (m), 1265 (m), $1067(\mathrm{br})$ and $803(\mathrm{w}) ; \delta_{\mathrm{H}} 1.19\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CCH}_{3}\right)$ and $9.09(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}} 28.0(\mathrm{C}), 30.2$ ( 3 $\mathrm{x} \mathrm{CCH} 3), 71.6,99.6(\mathrm{C} \equiv \mathrm{C})$ and $158.0(\mathrm{C}=\mathrm{O})$. These data are consistent with those recorded in the literature. ${ }^{103 \mathrm{c}}$

6-(tert-Butyldimethylsilyloxy)-hex-2-ynal $2230{ }^{\text {103d }}$

The ynyloxy-silane $229\left(9.00 \mathrm{~g}, 45.4 \mathrm{mmol}\right.$ ) in anhydrous tetrahydrofuran ( 45 mL ) at $-40^{\circ} \mathrm{C}$ was reacted with $n$-butyl lithium ( 18 mL of a 2.5 M solution in hexanes, 45.8 mmol ) dropwise and anhydrous dimethylformamide ( $7.00 \mathrm{~mL}, 91 \mathrm{mmol}$ ) according to the general procedure. Work-up yielded the aldehyde 230 as a brownish oil ( $8.40 \mathrm{~g}, 82 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] $2955(\mathrm{~m})$, 2929 (s), 2856 (m), 2203 (s), 1671 (s), 1472 (w), 1388 (w), 1256 (m), 1136 (m), 1106 (s), 959 (w), $837(\mathrm{~s})$ and $776(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.74(2 \mathrm{H}$, pen, $J$ $\left.6.5,5-\mathrm{CH}_{2}\right), 2.46\left(2 \mathrm{H}, \mathrm{t}, J 6.5,4-\mathrm{CH}_{2}\right), 3.58\left(2 \mathrm{H}, \mathrm{t}, J 6.5,6-\mathrm{CH}_{2}\right)$ and $9.16(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}}-$ $5.4\left(2 \times \mathrm{SiCH}_{3}\right), 15.7\left(5-\mathrm{CH}_{2}\right), 18.3(\mathrm{SiC}), 25.9\left(3 \times \mathrm{CH}_{3}\right), 30.6\left(4-\mathrm{CH}_{2}\right), 61.1\left(6-\mathrm{CH}_{2}\right), 81.7$, $99.1(\mathrm{C} \equiv \mathrm{C})$ and $177.2(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 227\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 211(50), 95$ (28). These data are consistent with those recorded in the literature. ${ }^{103 \mathrm{~d}}$

## 7-(tert-Butyldimethylsilanyloxy)-hept-2-ynal $232{ }^{102 b}$

The ynyloxy-silane $231\left(6.00 \mathrm{~g}, 25 \mathrm{mmol}\right.$ ) in anhydrous tetrahydrofuran ( 25 mL ) at $-40^{\circ} \mathrm{C}$ was reacted with $n$-butyl lithium ( 10 mL of a 2.5 M solution in hexanes, 25 mmol ) dropwise and anhydrous dimethylformamide ( $3.90 \mathrm{~mL}, 50 \mathrm{mmol}$ ) according to the general procedure. Work-up yielded the aldehyde 232 as a brownish oil ( $4.42 \mathrm{~g}, 80 \%$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2953 (s), $2857(\mathrm{~m}), 2201(\mathrm{~s}), 1672(\mathrm{~s}), 1102(\mathrm{~s}), 1256(\mathrm{~m}), 1106(\mathrm{~s}), 837(\mathrm{~s})$ and $776(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00(6 \mathrm{H}, \mathrm{s}$, $\left.2 \times \mathrm{SiCH}_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.55-1.62\left(4 \mathrm{H}, \mathrm{m}, 5-\mathrm{and} 6-\mathrm{CH}_{2}\right), 2.40(2 \mathrm{H}, \mathrm{t}, J 6.6,4-$ $\left.\mathrm{CH}_{2}\right), 3.59\left(2 \mathrm{H}, \mathrm{t}, J 6.6,7-\mathrm{CH}_{2}\right)$ and $9.13(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}}-4.9\left(2 \times \mathrm{SiCH}_{3}\right), 19.3,26.0(5-$ and $\left.6-\mathrm{CH}_{2}\right), 24.5(\mathrm{SiC}), 26.3\left(3 \mathrm{xCH}_{3}\right), 32.1\left(4-\mathrm{CH}_{2}\right), 62.7\left(7-\mathrm{CH}_{2}\right), 82.1,86.5(2 \times \mathrm{C} \equiv)$ and
$177.7(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 241\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 225(18), 157(45), 109$ (100). These data are consistent with those recorded in the literature. ${ }^{102 \mathrm{~b}}$

## General Procedure for the Prepaprtion of $\beta$-Hydroxy- $\alpha$-Amino Ester from Chelated Glycine Enolates ${ }^{33}$

Diisopropylamine ( $10 \mathrm{mmol}, 2.5$ eq.) was dissolved in anhydrous tetrahydrofuran ( 5 mL ) at $0^{\circ}$. A solution of $n$-butyl lithium ( 5 mL of a 2.5 M solution in hexanes, $10 \mathrm{mmol}, 2.5 \mathrm{eq}$.) was added dropwise and the solution stirred at $0^{\circ} \mathrm{C}$ for 30 min . The lithium diisopropylamide solution thus formed was cooled to $-78^{\circ} \mathrm{C}$. A solution of methyl N -tosyl glycinate $\mathbf{1 5 4}$ (1.00 $\mathrm{g}, 4 \mathrm{mmol}, 1 \mathrm{eq}$.$) and tin(II) chloride ( 1.9 \mathrm{~g}, 10 \mathrm{mmol}, 2.5 \mathrm{eq}$.) in anhydrous tetrahydrofuran $(25 \mathrm{~mL})$ was added dropwise and the resulting mixture stirred at $-78^{\circ} \mathrm{C}$ for 10 min . The ynal $122\left(0.53 \mathrm{~g}, 4.8 \mathrm{mmol}, 1.2 \mathrm{eq}\right.$.) was then added and the reaction stirred at $-78^{\circ} \mathrm{C}$ for 30 min , then quenched by pH 7 buffer solution ( 5 mL ) and diluted with diethyl ether ( 5 mL ). The mixture was allowed to warm to room temperature over 2 h and filtered through celite. The layers were then separated and the aqueous layer extracted with diethyl ether ( $3 \times 5 \mathrm{~mL}$ ). The combined ether extracts were washed with brine ( 5 mL ) and dried. Removal of the solvent on a rotary evaporator gave the crude product as a yellow solid. Column chromatography gave the hydroxy ester 120.

Methyl (2SR,3SR)-3-hydroxy-5-phenyl-2- (4-methylphenylsulfonylamino)-pent-4-ynoate 160

To a solution of lithium diisopropylamine ( $1.4 \mathrm{~mL}, 10 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 5 mL ) at $-78^{\circ}$ was added a solution of methyl $N$-tosyl glycinate 154 ( $1.00 \mathrm{~g}, 4 \mathrm{mmol}$ ), tin(II) chloride ( $1.9 \mathrm{~g}, 10 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 25 mL ) and 3-phenyl-2-propynal 224 $(0.53 \mathrm{~g}, 4.8 \mathrm{mmol})$ as described in the general procedure. After the work-up, the product was
purified to give the hydroxy ester 160 as a pale yellow solid ( $1.143 \mathrm{~g}, 76 \%$ ), mp $133-134^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}$ 0.2 ( $40 \%$ ethyl acetate in petroleum ether), anti:syn $=90: 10 ; v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3328 (br), 2923 (s), 2854 (s), 1750 (w), 1462 (m), 1377 (w), 1234 (w), 1156 (w), 1090 (w) and 762 (w); $\delta_{\mathrm{H}}$ (major isomer) $2.36\left(3 \mathrm{H}, \mathrm{s} \mathrm{ArCH}_{3}\right), 2.88(1 \mathrm{H}, \mathrm{d}, J 10.2, \mathrm{OH}), 3.55\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.18(1 \mathrm{H}$, dd, $J 9.5,3.4,2-\mathrm{H}), 4.82(1 \mathrm{H}, \mathrm{dd}, J 10.2,3.4,3-\mathrm{H}), 5.54(1 \mathrm{H}, \mathrm{br}$ d, $J 9.5, \mathrm{NH}), 7.20-7.33$ ( 7 H , $\mathrm{m}, \mathrm{ArH})$ and $7.70(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 23.0\left(\mathrm{ArCH}_{3}\right), 53.5\left(\mathrm{OCH}_{3}\right), 61.0(2-\mathrm{CH}), 64.0$ (3-CH), 85.0, $87.3(\mathrm{C} \equiv \mathrm{C}), 121.9(\mathrm{ArC}), 127.8(2 \times \mathrm{ArCH}), 128.7(2 \times \mathrm{ArCH}), 129.0(\mathrm{ArCH})$, $130.2(2 \mathrm{x} \mathrm{ArCH}), 132.2(2 \times \mathrm{ArCH}), 136.9,146.0(2 \mathrm{x} \mathrm{ArC})$ and $168.6(\mathrm{C}=\mathrm{O}) ; m / z$ [APcI] 374 ( $[\mathrm{M}+\mathrm{H}]^{+}, 5$ ), 356 (100), 201 (50), 170 (40), 152 (80); Found: $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 391.1322$. $\mathrm{C}_{19} \mathrm{H}_{23} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}$ requires $M, 391.1317$.

The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 2.29\left(3 \mathrm{H}, \mathrm{s} \mathrm{ArCH}_{3}\right)$ and $3.60(3 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ). The ratio was calculated by careful integration of these resonances.

## Methyl (2SR,3SR)-3-hydroxy-2-(4-methylphenylsulfonylamino)-non-4-ynoate 161

To a solution of lithium diisopropylamine ( $1.4 \mathrm{~mL}, 10 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 5 mL ) at $-78^{\circ}$ was added a solution of methyl $N$-tosyl glycinate 154 ( $1.00 \mathrm{~g}, 4 \mathrm{mmol}$ ) and tin(II) chloride ( $1.9 \mathrm{~g}, 10 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 25 mL ) and 2-heptynal $226(0.53 \mathrm{~g}$, 4.8 mmol ) as described in the general procedure. After the work-up, the product was purified to give the hydroxy ester 161 as a pale yellow solid ( $1.70 \mathrm{~g}, 64 \%$ ), $\mathrm{mp} 64-65^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.32(40 \%$ ethyl acetate in petroleum ether), anti:syn $=96: 4 ; v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3424 (w), 3246 (w), 2930 (s), 2855 (s), 2190 (w), 1750 (w), 1456 (m), 1376 (w), 1159 (w) and $1090(\mathrm{w}) ; \delta_{\mathrm{H}}$ (major isomer) $0.82\left(3 \mathrm{H}, \mathrm{t}, J 7.2,9-\mathrm{CH}_{3}\right), 1.25-1.31\left(2 \mathrm{H}, \mathrm{m}, 8-\mathrm{CH}_{2}\right), 1.34-1.39\left(2 \mathrm{H}, \mathrm{m}, 7-\mathrm{CH}_{2}\right), 2.09$ $\left(2 \mathrm{H}, \mathrm{td}, J 7.2,1.8,6-\mathrm{CH}_{2}\right), 2.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.66(1 \mathrm{H}, \mathrm{d}, J 10.5, \mathrm{OH}), 3.50\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 4.06 (1H, dd, $J 9.6,3.6,2-\mathrm{H}), 4.57$ ( 1 H , ddt, $J 10.5,3.6,1.8,3-\mathrm{H}$ ), 5.43 ( $1 \mathrm{H}, \mathrm{d}, J 9.6, \mathrm{NH}$ ), $7.24(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$ and $7.68(2 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{ArH}) ; \delta_{\mathrm{C}} 13.6\left(9-\mathrm{CH}_{3}\right), 17.8\left(8-\mathrm{CH}_{2}\right), 21.4$ $\left(\mathrm{ArCH}_{3}\right), 24.4,30.1\left(6-\right.$ and $\left.7-\mathrm{CH}_{2}\right), 52.3\left(\mathrm{OCH}_{3}\right), 59.8(2-\mathrm{CH}), 63.8(3-\mathrm{CH}), 74.8,89.5$ $(\mathrm{C} \equiv \mathrm{C}), 127.7,129.3($ both $2 \times \mathrm{ArCH}), 135.2,145.0(2 \times \mathrm{ArC})$ and $168.2(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}]$
$354\left([\mathrm{M}+\mathrm{H}]^{+}, 80\right), 336$ (100), 139 (30); Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{5} \mathrm{~S}: \mathrm{C}, 57.79 ; \mathrm{H}, 6.52 ; \mathrm{N}$, 3.97. Found: C, 57.87; H, 6.53; N, 4.01\%.

The minor isomer was identified by resonance at $\delta_{\mathrm{H}} 3.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$. The ratio was calculated by careful integration of this resonance.

## Methyl (2SR,3SR)-3-hydroxy-6,6-dimethyl-2-(4-methylphenylsulfonylamino)-hept-4-ynoate 162

To a solution of lithium diisopropylamine ( $4.2 \mathrm{~mL}, 30 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(15 \mathrm{~mL})$ at $-78^{\circ}$ was added a solution of methyl $N$-tosyl glycinate $154(3.00 \mathrm{~g}, 12 \mathrm{mmol})$ and $\operatorname{tin}(\mathrm{II})$ chloride ( $5.70 \mathrm{~g}, 30 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 75 mL ) and 4,4-dimethyl-2pentynal $228(1.58 \mathrm{~g}, 14.4 \mathrm{mmol})$ as described in the general procedure. After the work-up, the product was purified to give the hydroxy ester 162 as a colourless solid ( $6.93 \mathrm{~g}, 65 \%$ ), mp $128-129^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.41$ ( $40 \%$ ethyl acetate in petroleum ether), anti: syn $=100: 0 ; v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3498 (w), 3267 (w), 2969 (w), 2242 (w), 1743 (m), 1598 (w), 1435 (w), 1342 (m), 1265 (w), 1163 (s), $1092(\mathrm{~m}), 815(\mathrm{w})$ and $666(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.17\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.43\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.65$ $(1 \mathrm{H}, \mathrm{d}, J 10.4, \mathrm{OH}), 3.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.13(1 \mathrm{H}, \mathrm{dd}, J 9.6,3.9,2-\mathrm{H}), 4.63(1 \mathrm{H}, \mathrm{dd}, J 10.4$, $3.9,3-\mathrm{H}), 5.46(1 \mathrm{H}, \mathrm{d}, J 9.6, \mathrm{NH}), 7.31(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \mathrm{x} \mathrm{ArH})$ and $7.75(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \mathrm{x}$ $\mathrm{ArH}) ; \delta_{\mathrm{C}} 21.6\left(\mathrm{ArCH}_{3}\right), 27.4(\mathrm{C}), 31.0\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 52.7\left(\mathrm{OCH}_{3}\right), 60.6(2-\mathrm{CH}), 62.9(3-\mathrm{CH})$, 74.0, $86.8(\mathrm{C} \equiv \mathrm{C}), 127.3,129.7$ (both $2 \times \mathrm{ArCH}$ ), 136.2, $144.0(2 \times \mathrm{ArC})$ and $168.7(\mathrm{C}=\mathrm{O})$; $m / z[\mathrm{APcI}] 354\left([\mathrm{M}+\mathrm{H}]^{+}, 35\right), 336(100), 308(15), 137(20)$; Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{23} \mathrm{NO}_{5} \mathrm{~S}: \mathrm{C}$, 57.79; H, 6.52; N, 3.97. Found: C, 57.88; H, 6.73; N, 4.15\%.

Methyl (2SR,3SR)-8-(tert-butyldimethylsilyloxy)-3-hydroxy-2-(4-methyl phenylsulfonylamino)-oct-4-ynoate 163

To a solution of lithium diisopropylamine ( $4.2 \mathrm{~mL}, 30 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(15 \mathrm{~mL})$ at $-78^{\circ}$ was added a solution of methyl $N$-tosyl glycinate $154(3.00 \mathrm{~g}, 12 \mathrm{mmol})$ and $\operatorname{tin}(\mathrm{II})$ chloride ( $5.70 \mathrm{~g}, 30 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 75 mL ) and the 6 -(silyloxy)-hex-2-ynal $230(3.25 \mathrm{~g}, 14.4 \mathrm{mmol})$ as described in the general procedure. After the work-up, the product was purified to give the hydroxy ester 163 as a light yellow solid ( $3.38 \mathrm{~g}, 60 \%$ ), $\mathrm{mp} 72-73^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.62$ ( $40 \%$ ethyl acetate in petroleum ether), anti:syn $=92: 8 ; v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3478 (w), 3280 (w), 2954 (m), 2856 (m), 2232 (w), 1744 (m), 1594 (w), 1435 (w), 1342 (m), $1255(\mathrm{~m}), 1164(\mathrm{~s}), 1094(\mathrm{~s}), 836(\mathrm{~s}), 776(\mathrm{~m})$ and $664(\mathrm{~m}) ; \delta_{\mathrm{H}}$ (major isomer) $0.00(6 \mathrm{H}, \mathrm{s}, 2 \mathrm{x}$ $\left.\mathrm{SiCH}_{3}\right), 0.85\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.61\left(2 \mathrm{H}\right.$, pen, $\left.J 6.1,7-\mathrm{CH}_{2}\right), 2.21\left(2 \mathrm{H}, \mathrm{td}, J 6.1,2.0,6-\mathrm{CH}_{2}\right)$, $2.38\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.67(1 \mathrm{H}, \mathrm{d}, J 10.0, \mathrm{OH}), 3.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.63\left(2 \mathrm{H}, \mathrm{t}, J 6.1,8-\mathrm{CH}_{2}\right)$, $4.13(1 \mathrm{H}, \mathrm{dd}, J 9.6,3.7,2-\mathrm{H}), 4.64(1 \mathrm{H}, \mathrm{ddt}, J 10.0,3.7,2.0,3-\mathrm{H}), 5.45(1 \mathrm{H}, \mathrm{d}, J 9.6, \mathrm{NH})$, $7.26(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$ and $7.7(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}-5.4\left(2 \times \mathrm{SiCH}_{3}\right), 15.4$ (7$\left.\mathrm{CH}_{2}\right), 18.3(\mathrm{C}), 21.6\left(\mathrm{ArCH}_{3}\right), 26.3\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 31.8\left(6-\mathrm{CH}_{2}\right), 53.3\left(\mathrm{OCH}_{3}\right), 61.0(2-\mathrm{CH}), 61.7$ $\left(8-\mathrm{CH}_{2}\right), 63.5(3-\mathrm{CH}), 76.0,89.2(\mathrm{C} \equiv \mathrm{C}), 126.3,127.7$ (both 2 x ArCH$), 136.1,143.2$ ( 2 x $\mathrm{ArC})$ and $168.0(\mathrm{C}=\mathrm{O})$; $m / z$ [APcI] $470\left([\mathrm{M}+\mathrm{H}]^{+}, 100 \%\right), 452$ (60), 93 (55); Anal. Calcd for $\mathrm{C}_{22} \mathrm{H}_{35} \mathrm{NO}_{6} \mathrm{SSi}$ C, 56.25 ; H, 7.46; N, 2.98. Found: C, 56.04; H, 7.49; N, 2.96\%.

The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 2.57(1 \mathrm{H}, \mathrm{d}, J 10.0, \mathrm{OH})$ and $5.35(1 \mathrm{H}$, $\mathrm{d}, J 9.6, \mathrm{NH})$. The ratio was calculated by careful integration of these resonances.

## Methyl (2SR,3SR)-9-(tert-butyldimethylsilyloxy)-3-hydroxy-2-(4-methyl phenylsulfonylamino)-non-4-ynoate 164

To a solution of lithium diisopropylamine ( $2.1 \mathrm{~mL}, 15 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 8 $\mathrm{mL})$ at $-78^{\circ}$ was added a solution of methyl $N$-tosyl glycine ester $154(1.50 \mathrm{~g}, 6 \mathrm{mmol})$ and tin(II) chloride ( $2.85 \mathrm{~g}, 15 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 40 mL ) and the 7-(silyloxy)-hept-2-ynal $232(1.73 \mathrm{~g}, 7.2 \mathrm{mmol})$ as described in the general procedure. After the work-up, the product was purified to give the hydroxy ester 164 as a light yellow solid ( $2.90 \mathrm{~g}, 60 \%$ ), $\mathrm{mp} 81-82^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.57$ ( $40 \%$ ethyl acetate in petroleum ether), anti:syn $=90: 10 ; v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3488 (w), 3288 (w), 2954 (m), 2858 (w), 2232 (w), 1746 (s), 1598 (w), 1436 (m), 1337 ( s ), 1257 (m), 1163 ( s ), 1094 ( s$), 837$ (m), 814 (m), $77(\mathrm{w})$ and $663(\mathrm{~m}) ; \delta_{\mathrm{H}}$ (major
isomer) $0.04\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.89\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.58-1.65\left(4 \mathrm{H}, \mathrm{m}, 7-\right.$ and $\left.8-\mathrm{CH}_{2}\right), 2.21$ $\left(2 \mathrm{H}, \mathrm{td}, J 6.2,2.0,6-\mathrm{CH}_{2}\right), 2.42\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.74(1 \mathrm{H}, \mathrm{d}, J 10.4, \mathrm{OH}), 3.56\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.60\left(2 \mathrm{H}, \mathrm{t}, J 6.2,9-\mathrm{CH}_{2}\right), 4.13(1 \mathrm{H}, \mathrm{dd}, J 9.5,3.7,2-\mathrm{H}), 4.64(1 \mathrm{H}, \mathrm{br}$ d, $J 9.5, \mathrm{NH}), 5.51(1 \mathrm{H}$, ddt, $J 10.4,3.7,2.0,3-\mathrm{H}), 7.3(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$ and $7.75(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 0.0$ $\left(2 \times \mathrm{SiCH}_{3}\right), 15.9,16.2\left(7-\mathrm{and} 8-\mathrm{CH}_{2}\right), 18.7(\mathrm{C}), 22.4\left(\mathrm{ArCH}_{3}\right), 25.9\left(3 \times \mathrm{CH}_{3}\right), 33.1\left(6-\mathrm{CH}_{2}\right)$, $53.8\left(\mathrm{OCH}_{3}\right), 60.7(2-\mathrm{CH}), 62.6\left(9-\mathrm{CH}_{2}\right), 63.8(3-\mathrm{CH}), 76.6,89.3(\mathrm{C} \equiv \mathrm{C}), 127.4,129.8$ (both 2 x ArCH$), 136.5,143.9(2 \times \mathrm{ArC})$ and $168.4(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 484\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 466(20)$, 334 (50); Anal. The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 2.55(1 \mathrm{H}, \mathrm{d}, J 10.0, \mathrm{OH})$ and $5.54(1 \mathrm{H}$, d, $J 9.6, \mathrm{NH})$. The ratio was calculated by careful integration of these resonances.

## Methyl (2SR,3SR)-3,8-dihydroxy-2-(4'-methylphenylsulfonylamino)-oct-4-ynoate 240

To a stirred solution of the ester $163(2.0 \mathrm{~g}, 4.0 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 50 mL ) cooled to $0^{\circ} \mathrm{C}$ was added tetrabutylammonium fluoride ( 4.2 mL of a 1 M solution in THF, 4.2 mmol ) dropwise. The mixture was then allowed to stir for 16 h at room temperature. The mixture was then quenched with water ( 50 mL ) and diluted with dichloromethane ( 25 mL ). The separated organic layer was washed with water ( $2 \times 25 \mathrm{~mL}$ ), dried and evaporated to give light yellow oil. The crude oil was crystallized from hexane and ethyl acetate to give the alcohol 240 as a colourless solid ( $0.61 \mathrm{~g}, 43 \%$ ); mp $115-116^{\circ} \mathrm{C}$, anti:syn $=80: 20 ; \mathrm{R}_{\mathrm{f}} 0.07$ ( $50 \%$ ethyl acetate in hexane); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3498 (m), $3290(\mathrm{~m}$ ), 2945 (w), 2875 (w), 1728 (m), 1594 (w), 1433 (m), 1336 (m), 1162 (s), 1052 (w), 811 (w) and $650(\mathrm{~m}) ; \delta_{\mathrm{H}}$ (major isomer) $1.68\left(2 \mathrm{H}\right.$, pen, $\left.J 6.1,7-\mathrm{CH}_{2}\right), 2.25\left(2 \mathrm{H}, \mathrm{t}, J 6.1,6-\mathrm{CH}_{2}\right), 2.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.74$ $(1 \mathrm{H}, \mathrm{d}, J 9.7, \mathrm{OH}), 3.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.70\left(2 \mathrm{H}, \mathrm{t}, J 6.1,8-\mathrm{CH}_{2}\right), 4.11(1 \mathrm{H}, \mathrm{dd}, J 9.8,3.7,2-$ H), $4.58(1 \mathrm{H}, \mathrm{br} \mathrm{d}, J 9.8, \mathrm{NH}), 5.84(1 \mathrm{H}, \mathrm{dd}, J 9.7,3.7,3-\mathrm{H}), 7.26(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \times \mathrm{ArH})$ and $7.70(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 15.6\left(7-\mathrm{CH}_{2}\right), 21.6\left(\mathrm{ArCH}_{3}\right), 31.6\left(6-\mathrm{CH}_{2}\right), 52.9\left(\mathrm{OCH}_{3}\right), 60.8$ (2-CH), $61.7\left(8-\mathrm{CH}_{2}\right), 62.8$ (3-CH), 78.6, 83.3 ( $2 \times \mathrm{C} \equiv$ ), 127.3, 129.7 (both $2 \times \mathrm{ArCH}$ ), 136.5, $140.5(2 \times \mathrm{ArC})$ and $169.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 356\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 338$ (35), 306 (55); Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{NO}_{6} \mathrm{~S}: \mathrm{C}, 54.02 ; \mathrm{H}, 5.91$; N, 3.94. Found: C, $54.21 ; \mathrm{H}, 6.18 ; \mathrm{N}, 4.13 \%$.

The minor isomer was identified by resonance at $\delta_{\mathrm{H}} 4.64(1 \mathrm{H}, \mathrm{d}, J 9.6, \mathrm{NH})$. The ratio was calculated by careful integration of this resonance.

## Methyl (2SR,3SR)-8-benzoyloxy-3-hydroxy-2-(4'-methyl phenylsulfonylamino)-oct-4-

 ynoate 237 andMethyl (2SR,3SR)-3,8-dibenzoyloxy-2-(4'-methyl phenylsulfonylamino)-oct-4-ynoate 238

A solution of triethylamine ( $0.22 \mathrm{~mL}, 1.54 \mathrm{mmol}$ ), DMAP $(0.02 \mathrm{~g}, 0.15 \mathrm{mmol})$ and benzoyl chloride $(0.2 \mathrm{~mL}, 1.8 \mathrm{mmol})$ in dichloromethane $(5 \mathrm{~mL})$ was cooled to $0^{\circ} \mathrm{C}$ and to this was slowly added the alcohol $240(0.528 \mathrm{~g}, 1.5 \mathrm{mmol})$ in dichloromethane ( 5 mL ) during 90 min . The mixture was allowed to stir for 16 h at room temperature and then diluted with dichloromethane ( 25 mL ). The separated organic layer was washed with brine ( 25 mL ), saturated aqueous potassium carbonate $(25 \mathrm{~mL})$ and $1 \mathrm{M} \mathrm{HCl}(25 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. Finally, the organic layer was washed again with brine ( 25 mL ), then dried and evaporated to give a light brown oil. Column chromatography then separated the monobenzoate 237 as a pale yellow solid ( $0.30 \mathrm{~g}, 44 \%$ ); mp $79-80^{\circ} \mathrm{C}$, anti:syn $=80: 20 ; \mathrm{R}_{\mathrm{f}} 0.68$ ( $40 \%$ ethyl acetate in hexane); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3529 (m), 3278 (m), 2952 (m), 1725 (s), 1599 (w), 1493 (w), 1451 (m), 1340 (m), 1265 (s), 1208 (w), 1162 (s), 1092 (s), 1069 (m), 1026 (m), 982 (w), 815 (w), 714 $(\mathrm{m})$ and $665(\mathrm{~m}) ; \delta_{\mathrm{H}}$ (major isomer) $1.68\left(2 \mathrm{H}\right.$, pen, $\left.J 6.1,7-\mathrm{CH}_{2}\right), 2.25\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.22-$ $2.29\left(2 \mathrm{H}, \mathrm{m}, 6-\mathrm{CH}_{2}\right), 2.53(1 \mathrm{H}, \mathrm{br} \mathrm{d}, J 10.0, \mathrm{OH}), 3.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.12(2 \mathrm{H}, \mathrm{t}, J 6.1,8-$ $\mathrm{CH}_{2}$ ), $4.44(1 \mathrm{H}$, dd, $J 10.0,3.6,2(3)-\mathrm{H}), 5.11(1 \mathrm{H}, \mathrm{dd}, J 10.0,3.6,3(2)-\mathrm{H}), 5.79(1 \mathrm{H}, \mathrm{br} \mathrm{d}, J$ $10.0, \mathrm{NH}), 7.10(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{xArH}), 7.33(2 \mathrm{H}, \mathrm{d}, J 7.4,2 \times \mathrm{ArH}), 7.49(1 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{ArH})$, $7.64(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$ and $7.87(2 \mathrm{H}, \mathrm{d}, J 7.4,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 16.1\left(7-\mathrm{CH}_{2}\right), 21.9\left(\mathrm{ArCH}_{3}\right)$, $30.9\left(6-\mathrm{CH}_{2}\right), 53.6\left(\mathrm{OCH}_{3}\right), 59.0(2(3)-\mathrm{CH}), 65.0\left(8-\mathrm{CH}_{2}\right), 65.2(3(2)-\mathrm{CH}), 73.3,90.3(2 \mathrm{x}$ $\mathrm{C} \equiv$ ), 127.4, 128.9 (both 2 x ArCH ), 129.3 ( ArC ), 130, 130.4 (both $2 \times \mathrm{ArCH}$ ), 133.9 ( ArCH ), 137.5, $143.9(2 \times \mathrm{ArC})$ and $165.6,168.8$ (both $\mathrm{C}=\mathrm{O}$ ); $m / z[\mathrm{APcI}] 460\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 442$ (40), 338 (40), 306 (30), 182 (50); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 460.1432 . \mathrm{C}_{23} \mathrm{H}_{26} \mathrm{NO}_{7} \mathrm{~S}$ requires $M$, 460.1424 .

The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 4.34(1 \mathrm{H}, \mathrm{dd}, J 10.0,3.6,2(3)-\mathrm{H})$ and $5.91(1 \mathrm{H}, \mathrm{dd}, J 10.0,3.6,3(2)-\mathrm{H})$. The ratio was calculated by careful integration of these resonances;

Earlier fractions gave the dibenzoate 238 as a yellow solid ( $0.26 \mathrm{~g}, 37 \%$ ); $\mathrm{mp} 66-67^{\circ} \mathrm{C}$, anti:syn $=80: 20 ; \mathrm{R}_{\mathrm{f}} 0.76$ (40\% ethyl acetate in hexane); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3264 (w), 3056 (w), 2957 (w), 2242 (w), 1720 (s), 1600 (w), 1492 (w), 1451 (m), 1343 (m), 1272 (s), 1165 (s), $1093(\mathrm{~s}), 1026(\mathrm{~m}), 814(\mathrm{w})$ and $713(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.90\left(2 \mathrm{H}\right.$, pent, $\left.J 6.7,7-\mathrm{CH}_{2}\right), 3.14-3.46(5 \mathrm{H}, \mathrm{m}$, $6-\mathrm{CH}_{2}$ and $\left.\mathrm{ArCH}_{3}\right), 3.60\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.65-3.84\left(2 \mathrm{H}, \mathrm{m}, 8-\mathrm{CH}_{2}\right), 4.47(1 \mathrm{H}, \mathrm{dd}, J 9.9,3.6$, $2(3)-\mathrm{H}), 5.78-5.84(2 \mathrm{H}, \mathrm{m}, \mathrm{NH}$ and $3(2)-\mathrm{H}), 7.12(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH}), 7.31-7.36(4 \mathrm{H}, \mathrm{m}, 2$ x ArH and 2 x ArH ), $7.53-7.61(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}), 7.67(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH}), 7.92(2 \mathrm{H}, \mathrm{d}, J$ $7.2,2 \times \mathrm{ArH})$ and $7.97(2 \mathrm{H}, \mathrm{d}, J 7.2,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 15.6\left(7-\mathrm{CH}_{2}\right), 21.6\left(\mathrm{ArCH}_{3}\right), 27.4\left(6-\mathrm{CH}_{2}\right)$, $53.2\left(\mathrm{OCH}_{3}\right), 58.5(2(3)-\mathrm{CH}), 63.1\left(8-\mathrm{CH}_{2}\right), 64.7(3(2)-\mathrm{CH}), 73.4,88.5(2 \times \mathrm{C} \equiv), 127.1,128.3$ (both 2 x ArCH ), 129, 129.3 ( 2 x ArCH ), 129.6, 130.0 (both $2 \times \mathrm{ArCH}$ ), 130.2, 130.5 (both 2 $\mathrm{x} \mathrm{ArCH}), 133.1,133.4(2 \times \mathrm{ArC}), 137.1,143.6(2 \mathrm{x} \mathrm{ArC})$ and 165.2, 166.6, 168.1 ( $3 \mathrm{x} \mathrm{C}=\mathrm{O}$ ); $m / z[\mathrm{APcI}] 564\left([\mathrm{M}+\mathrm{H}]^{+}, 30\right), 469(15), 151$ (15), 72 (100).

The minor isomer was identified by resonance at $\delta_{\mathrm{H}} 3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$. The ratio was calculated by careful integration of this resonance.

## Methyl 2-(4'-methylphenylsulfonylamino)-propanoate $\mathbf{2 5 0}^{104}$

Alanine methyl ester ( $10 \mathrm{~g}, 71.6 \mathrm{mmol}$ ) and $p$-toluenesulfonyl chloride ( $15 \mathrm{~g}, 78.8 \mathrm{mmol}$ ) were placed in a dry round bottom flask and partially dissolved in 200 mL of anhydrous dichloromethane. After adding DMAP ( $1.75 \mathrm{~g}, 17.33 \mathrm{mmol}$ ), the reaction mixture was cooled to $0^{\circ} \mathrm{C}$ and triethylamine ( $20 \mathrm{~mL}, 143.3 \mathrm{mmol}$ ) added dropwise. The resulting mixture was allowed to stir for 30 min at $0^{\circ} \mathrm{C}$, then left to stir at room temperature. After 18 h , the mixture was washed with 50 mL of 2 M HCl and then diluted with dichloromethane ( 100 mL ). The mixture was separated and the organic layer washed with water ( 100 mL ) and brine ( 100 mL ) then dried and evaporated. When the crude product ( 16.3 g ) was completely dried, it was recrystallized from petroleum ether $40-60^{\circ} \mathrm{C}$ and diethyl ether; the mixture was kept in the freezer overnight. The precipitate was filtered and the solid washed with ice-cold diethyl ether.

The dried product was the $N$-tosyl ester $250(15.3 \mathrm{~g}, 83 \%)$ as colourless crytals, mp $95-96^{\circ} \mathrm{C}$ [lit. $\mathrm{mp}^{4} 94-95^{\circ} \mathrm{C}$ ]. $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3264 (m), 1734 (m), 1436 (w), 1335 (m), 1209 (w), 1163 (s), $1092(\mathrm{~s}), 815(\mathrm{w})$ and $650(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.38\left(3 \mathrm{H}, \mathrm{d}, J 6.7, \mathrm{CH}_{3}\right), 2.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.52(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{OCH}_{3}\right), 3.97(1 \mathrm{H}, \mathrm{dq}, J 8.4,6.7,2-\mathrm{H}), 5.22(1 \mathrm{H}, \mathrm{d}, J 8.4, \mathrm{NH}), 7.28(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$ and $7.73(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 16.2\left(\mathrm{CH}_{3}\right), 21.2\left(\mathrm{ArCH}_{3}\right), 49.6(2-\mathrm{CH}), 50.2\left(\mathrm{OCH}_{3}\right)$, $125.7(2 \times \mathrm{ArCH}), 129.8(2 \times \mathrm{ArCH}), 138.4,146.9(2 \times \mathrm{ArC})$ and $171.8(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}]$ $258\left([\mathrm{M}+\mathrm{H}]^{+}, 55\right), 198$ (100). These data are consistent with those recorded in the literature. ${ }^{104}$

## 7-Hydroxy-7-[1'-(4-methylphenylsulfonylamino)ethyl|-trideca-5,8-diyne 251

To a solution of 1-hexyne ( $22.0 \mathrm{~mL}, 189 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 50 mL ) maintained at $-40^{\circ} \mathrm{C}$ was added 2.5 M n -butyl lithium ( 76 mL in hexanes, 189 mmol ) dropwise and, when addition was completed, the ester $250(16.2 \mathrm{~g}, 63 \mathrm{mmol})$ was added in one portion. The mixture was then warmed to room temperature and stirred for 30 min , then poured into a mixture of $10 \%$ aqueous $\mathrm{KH}_{2} \mathrm{PO}_{4}(600 \mathrm{~mL}, 480 \mathrm{mmol})$ and diethyl ether ( 600 mL ) at $5^{\circ} \mathrm{C}$ and the resulting two-phase mixture stirred for 10 min . The aqueous layer was separated and extracted with ether ( $2 \times 300 \mathrm{~mL}$ ), The combined organic solutions were then dried and evaporated to leave the alcohol $251(20.9 \mathrm{~g}, 85 \%)$ as a colourless crystalline solid, $\mathrm{mp} 53-54^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.58$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3465 (br), 3274 (br), 2956 (s), 2926 (s), 2868 (s), 2233 (m), 1596 (w), 1431 (m), 1379 (w), 1329 (m), $1163(\mathrm{~s}), 1092(\mathrm{~m}), 1020(\mathrm{w}), 915(\mathrm{w}), 814(\mathrm{w})$ and $655(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.76-0.81\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{3}\right)$, $1.10\left(3 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{CH}_{3}\right), 1.23-1.38\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.02-2.08\left(10 \mathrm{H}, \mathrm{m}, 5 \times \mathrm{CH}_{2}\right), 2.30(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 2.72(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 3.35\left(1 \mathrm{H}, \mathrm{dq}, J 9.1,6.6,1^{\prime}-\mathrm{H}\right), 4.55(1 \mathrm{H}, \mathrm{d}, J 9.1, \mathrm{NH}), 7.18(2 \mathrm{H}$, d, $J 8.1,2 \mathrm{x} \mathrm{ArH})$ and $7.66(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 13.6\left(2 \mathrm{x} \mathrm{CH}_{3}\right), 17.7\left(\mathrm{CH}_{3}\right), 18.3(2 \mathrm{x}$ $\left.\mathrm{CH}_{2}\right), 21.5\left(\mathrm{ArCH}_{3}\right), 22.0,30.3\left(4 \mathrm{x} \mathrm{CH}_{2}\right), 58.9(1$ ' -CH ), $68.3(2 \times \mathrm{C} \equiv), 78.67(7-\mathrm{COH}), 86.2$ ( $2 \times \mathrm{C} \equiv$ ), $127.6(2 \times \mathrm{ArCH}), 130.1(2 \times \mathrm{ArCH})$ and 138.0, $143.9(2 \times \mathrm{ArC}) ; m / z$ [APcl] 372 ( $\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 55$ ), 143 (30), 113 (38), 83 (65), 71 (100); Anal. ## General procedure for PCC oxidation of $\boldsymbol{\beta}$-hydroxy sulphonamides to tosylamino ketones

To a dried two-necked round bottom flask was added 0.5 g of $4^{\circ} \mathrm{A}$ molecular sieves, which has been dried in an oven at $110^{\circ} \mathrm{C}$ for at least 24 h . After the molecular sieves had cooled down to room temperature by using a nitrogen flow, pyridinium chlorochromate ( 0.44 g , $2.04 \mathrm{mmol}, 1.5 \mathrm{eq}$.) was added. The mixture was suspended in anhydrous dichloromethane ( 5 mL ), then cooled down to $0^{\circ} \mathrm{C}$. The alcohol ( $1.36 \mathrm{mmol}, 1 \mathrm{eq}$.) in dichloromethane ( 5 mL ) was added and the mixture stirred for 15 h at room temperature, then filtered through plug of silica gel using $10-60 \%$ diethyl ether in petroleum ether as an eluant. The filtrate was then evaporated and dried under high vacuum to give the crude ketone.

## 2-(4-Methylphenylsulfonylamino) -1,2-diphenylethanone $260{ }^{105}$

To a mixture of $4^{\circ} \mathrm{A}$ molecular sieves $(0.5 \mathrm{~g})$ and pyridinium chlorochromate $(0.44 \mathrm{~g}, 2.04$ mmol ) in anhydrous dichloromethane ( 5 mL ) was added $N$-(2-hydroxy-1,2-diphenyl-ethyl)-4methylphenylsulfonamide 261 ( $0.50 \mathrm{~g}, 1.36 \mathrm{mmol}$ ) in dichrolomethane ( 5 mL ) as described in general precedure. Work-up and evaporation gave the ketone 260 as a colourless solid $(0.40 \mathrm{~g}$, $80 \%$ ), mp $140-141^{\circ} \mathrm{C}$ [lit. $\mathrm{mp}^{5} 141-143^{\circ} \mathrm{C}$ ]; $\mathrm{R}_{\mathrm{f}} 0.78$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3256 (m), $1680(\mathrm{~m}), 1599$ (w), 1448 (w), 1329 (m), 1161 (s), 1087 (m) and $700(\mathrm{~s}) ; \delta_{\mathrm{H}} 2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 5.92(1 \mathrm{H}, \mathrm{d}, J 7.4,1-\mathrm{CH}), 6.14(1 \mathrm{H}, \mathrm{d}, J 7.4, \mathrm{NH}), 6.99(2 \mathrm{H}$, d, $J 8.1,2 \times \mathrm{ArH}), 7.17(5 \mathrm{H}$, app. s, 5 xArH$), 7.29(2 \mathrm{H}, \mathrm{t}, J 7.6,2 \times \mathrm{ArH}), 7.42-7.52(3 \mathrm{H}, \mathrm{m}$, $3 \times \mathrm{ArH})$ and $7.73(2 \mathrm{H}, \mathrm{d}, J 7.6,2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 20.8\left(\mathrm{ArCH}_{3}\right), 63.4(1-\mathrm{CH}), 125.6(2 \mathrm{x} \mathrm{ArCH})$, 127.1, 127.4, 128.4 ( $3 \times \mathrm{ArCH}$ ), 128.5, 128.7 ( 4 x ArCH ), 128.9, 129.3 ( 4 x ArCH ), 131.8 $(\mathrm{ArCH}), 135.2,137.5,134.5,136.9(4 \times \mathrm{ArC})$ and $195.6(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 366\left([\mathrm{M}+\mathrm{H}]^{+}\right.$, 100), 210 (25), 195 (40). These data are consistent with those recorded in the literature. ${ }^{105}$
(2RS,3SR)-3-(4-methylphenylsulfonylamino)-butan-2-ol 206

To a solution of (DHQD) $)_{2} \mathrm{AQN} 253(0.11 \mathrm{~g}, 0.125 \mathrm{mmol})$, chloroamine-T trihydrate $(2.11 \mathrm{~g}$, 7.5 mmol ) and potassium osmate dihydrate ( $34 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in $t$-butanol $(50 \mathrm{~mL})$ and water $(50 \mathrm{~mL})$ was added condensed 2-butene $252(0.14 \mathrm{~g}, 2.5 \mathrm{mmol})$. The reaction was immersed in a room temperature water bath and the slurry stirred for 16 h (over the course of the reaction the color changed from brown to deep green and then to yellow). The mixture was evaporated to dryness, the residue treated with ethyl acetate:water ( $1: 1,50 \mathrm{~mL}$ ) and the resulting mixture stirred for 30 min . The organic layer was separated and the aqueous layer was extracted with ethyl acetate ( $2 \times 10 \mathrm{~mL}$ ). The combined organic solutions were washed with water ( 25 mL ), brine ( 25 mL ) and dried. Evaporation of the solvent gave the crude hydroxy-sulfonamide mixed with tosylsulfonamide $\left(\mathrm{TsNH}_{2}\right)$. Column chromatography (10$25 \%$ ethyl acetate in petroleum ether) gave the hydroxy-sulfonamide 206 as a colourless oil ( $0.41 \mathrm{~g}, 66 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3233 (br), 2990 (m), 1492 (w), 1428 (w), 1324 (m), 1158 (s), $1080(\mathrm{~m}), 826(\mathrm{~s})$ and $664(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.95\left(3 \mathrm{H}, \mathrm{d}, J 6.8, \mathrm{CH}_{3}\right), 1.05\left(3 \mathrm{H}, \mathrm{d}, J 6.3, \mathrm{CH}_{3}\right), 1.60(1 \mathrm{H}$, $\mathrm{br}, \mathrm{OH}), 2.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.07(1 \mathrm{H}, \mathrm{ddq}, J 8.1,7.2,6.3,3-\mathrm{H}), 3.54(1 \mathrm{H}, \mathrm{dq}, J 7.2,6.8,2-$ H), $4.68(1 \mathrm{H}, \mathrm{d}, J 8.1, \mathrm{NH}), 7.49(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \times \mathrm{ArH})$ and $7.70(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}$ $14.6\left(\mathrm{CH}_{3}\right), 17.2\left(\mathrm{CH}_{3}\right), 21.2\left(\mathrm{ArCH}_{3}\right), 50.1(3-\mathrm{CH}), 73.8(2-\mathrm{CH}), 125.6,130.3(4 \mathrm{x} \mathrm{ArCH})$ and 136.2140 .7 ( $2 \times \mathrm{ArC}$ ); $m / z[\mathrm{APcl}] 244$ ([M+H] $]^{+}, 100$ ).

## 3-(4-Methylphenylsulfonylamino)-butanone 205

To a mixture of $4^{\circ} \mathrm{A}$ molecular sieves ( 3.0 g ) and pyridinium chlorochromate ( $2.66 \mathrm{~g}, 12.4$ mmol ) in anhydrous dichloromethane ( 30 mL ) was added the hydroxy-sulfonamide 206 (2.00 $\mathrm{g}, 8.23 \mathrm{mmol}$ ) in anhydrous dichloromethane ( 30 mL ) as described in the general precedure for PCC oxidation. After work-up, flash chromatography ( $20-40 \%$ ethyl acetate in petroleum ether) gave the ketone 205 as a colourless oil ( $1.80 \mathrm{~g}, 91 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.39$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3258 (b), 2985 (w), 1682 (s), 1496 (w), 1434 (w), 1328 (s), $1160(\mathrm{~s}), 1089(\mathrm{~s}), 820(\mathrm{~s})$ and $665(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.28\left(3 \mathrm{H}, \mathrm{d}, J 7.1,4-\mathrm{CH}_{3}\right), 2.11\left(3 \mathrm{H}, \mathrm{s}, 1-\mathrm{CH}_{3}\right)$, $2.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.86(1 \mathrm{H}, \mathrm{dq}, J 9.2,7.1,3-\mathrm{H}), 5.44(1 \mathrm{H}, \mathrm{d}, J 9.2, \mathrm{NH}), 7.22(2 \mathrm{H}, \mathrm{d}, J 8.1$, $2 \mathrm{x} \mathrm{ArH})$ and $7.64(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 16.2\left(4-\mathrm{CH}_{3}\right), 20.8\left(1-\mathrm{CH}_{3}\right), 21.3\left(\mathrm{ArCH}_{3}\right), 58.6$ (3-CH), 126.9, 130.1 ( $4 \times \mathrm{ArCH}$ ), 136.7, 142.9 ( $2 \times \mathrm{ArC}$ ) and 206.4 ( $\mathrm{C}=\mathrm{O}$ ); $m / z$ [APcI] 242 $\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$.

## General procedures for the preparation of $\beta$-amino- $\alpha$-hydroxy alkynes by addition of acetylene to $\alpha$-aminocarbonyls

## Method 1

To a solution of lithium acetylide-ethylenediamine $254(0.12 \mathrm{~g}, 1.2 \mathrm{mmol}, 3 \mathrm{eq}$.$) in anhydrous$ dimethyl sulfoxide ( 1 mL ) at room temperature were added a solution of the amino-ketone ( 0.4 mmol, 1 eq.) in anhydrous dimethyl sulfoxide ( 2 mL ) dropwise. The reaction mixture was then stirred at room temperature for 16 h . Water ( 5 mL ) and diethyl ether ( 5 mL ) were added and stirring continued for 10 min . The aqueous layer was separated and extracted with ether ( $2 \times 5 \mathrm{~mL}$ ). The combined ether solutions were then dried and evaporated to give a crude product. After flash chromatography ( $40 \%$ ethyl acetate in petroleum ether), the acetylene was isolated as a mixture of diastereomers.

## Method 2

To a stirred solution of the acetylene ( $0.42 \mathrm{mmol}, 1.05 \mathrm{eq}$.) in anhydrous tetrahydrofuran ( 1 mL ) at $-40^{\circ} \mathrm{C}$ was added $2.5 \mathrm{M} n$-butyl lithium ( 0.17 mL in hexanes, $0.42 \mathrm{mmol}, 1.05 \mathrm{eq}$.) dropwise and, when this addition was completed, the ketone ( $0.4 \mathrm{mmol}, 1 \mathrm{eq}$.) was added in one portion. The reaction mixture was then warmed to room temperature and stirred for 30 min , then poured into a well-stirred mixture of $10 \%$ aqueous $\mathrm{KH}_{2} \mathrm{PO}_{4}(1 \mathrm{~mL}, 0.8 \mathrm{mmol})$ and diethyl ether ( 1 mL ) maintained at $5^{\circ} \mathrm{C}$ and the resulting mixture stirred vigorously for 10 min . The aqueous layer was separated and extracted with ether ( $2 \times 2 \mathrm{~mL}$ ). The combined organic layers were then dried and evaporated. The dried product gave the acetylene as a mixture of diasteromers.

## 3-Methyl-4-(4'-methylphenylsulfonylamino)-pent-1-yn-3-ol 255

To a solution of lithium acetylide-ethylenediamine ( $0.12 \mathrm{~g}, 1.2 \mathrm{mmol}$ ) in anhydrous dimethyl sulfoxide ( 1 mL ) at room temperature were added a solution of ketone $205(0.10 \mathrm{~g}, 0.4 \mathrm{mmol})$ in anhydrous dimethyl sulfoxide ( 2 mL ) as described in general precedure method 1 . After the work-up, flash chromatography ( $40 \%$ ethyl acetate in petroleum ether) gave the acetylene 255 $(0.10 \mathrm{~g}, 85 \%)$ as a mixture of diastereomers (48:52), mp $102-103^{\circ} \mathrm{C}: \mathrm{R}_{\mathrm{f}} 0.45$ ( $40 \%$ ethyl acetate in petroleum ether); $\nu_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3263 (br), 2983 (w), 2362 (w), 1598 (w), 1495 (w), 1433 (m), 1331 (s), 1163 (s), 1092 (s), 816 (s) and 667 (s); $\delta_{\mathrm{H}} 0.95$ (1.4H, d, J 6.7, 5$\mathrm{CH}_{3 \mathrm{a}}$ ), $0.98\left(1.6 \mathrm{H}, \mathrm{d}, J 6.7,5-\mathrm{CH}_{3 \mathrm{~b}}\right), 1.35\left(1.4 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3 \mathrm{a}}\right), 1.37\left(1.6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3 \mathrm{~b}}\right), 2.33-2.45$ $\left(4 \mathrm{H}, \mathrm{m}, 1-\mathrm{CH} \equiv\right.$ and $\left.\mathrm{ArCH}_{3}\right), 3.19\left(0.5 \mathrm{H}, \mathrm{dq}, J 9.1,6.7,4-\mathrm{H}_{\mathrm{a}}\right), 3.28(0.5 \mathrm{H}, \mathrm{dq}, J 9.1,6.7,4-$ $\left.\mathrm{H}_{\mathrm{b}}\right), 5.13\left(0.5 \mathrm{H}, \mathrm{d}, J 9.1, \mathrm{NH}_{\mathrm{a}}\right), 5.18\left(0.5 \mathrm{H}, \mathrm{d}, J 9.1, \mathrm{NH}_{\mathrm{b}}\right), 7.22(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH})$ and 7.73 ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}$ ); $\delta_{\mathrm{C}} 16.3,16.9,21.1,21.6\left(2 \mathrm{x} \mathrm{CH}_{3 \mathrm{a} \mathrm{\& b}}\right), 26.0,26.4\left(\mathrm{ArCH}_{3} \mathrm{a} \mathrm{\& b}\right), 57.5,58.5$ (4$\mathrm{CH}_{\mathrm{a} \mathrm{\& b}}$ ), 70.4 (3-C), $73.3,73.7$ and $84.4,84.9$ ( $2 \mathrm{x} \mathrm{C} \equiv$ a\&b ), 126.4, 127.1 and 129.8, 129.9 ( 4 x $\mathrm{ArCH}_{\mathrm{a} \mathrm{\& b}}$ ) and $137.4,137.5,143.4,143.7\left(2 \times \mathrm{ArC}{ }_{\mathrm{a} \mathrm{\& b}}\right) ; m / z[\mathrm{APcI}] 268\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 250$ ([M-OH] $]^{+}, 100$ ).

## 3-Methyl-4-(4'-methylphenylsulfonylamino)-1-trimethylsilylpent-1-yn-3-ol 257

To a stirred solution of trimethylsilylacetylene $297(0.06 \mathrm{~mL}, 0.42 \mathrm{mmol})$ in anhydrous tetrahydrofuran $(1 \mathrm{~mL})$ at $-40^{\circ} \mathrm{C}$ was added $2.5 \mathrm{M} n$-butyl lithium $(0.17 \mathrm{~mL}$ in hexanes, 0.42 $\mathrm{mmol})$ and the ketone $205(0.21 \mathrm{~g}, 0.4 \mathrm{mmol})$ as described in general procedure method 2 . After work-up, flash chromatography ( $20-40 \%$ ethyl acetate in petroleum ether) gave the acethylene $\mathbf{2 5 7}$ as a colourless solid ( $50 \mathrm{mg}, \mathbf{3 4 \%}$ ), as a mixture of diastereomers ( $61: 39$ ), mp $117-118^{\circ} \mathrm{C}: \mathrm{R}_{\mathrm{f}} 0.57$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3440 (br), 3263 (br), 2956 (w), 2170 (w), 1598 (w), 1430 (w), 1331 (m), 1250 (m), 1163 (s), 1092 (s), 945 (s), $816(\mathrm{~m}), 760(\mathrm{~m})$ and $670(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{SiCH}_{3}\right), 0.90\left(2 \mathrm{H}, \mathrm{d}, J 6.9,5-\mathrm{CH}_{3 \mathrm{a}}\right), 0.94$

Calcd for $\mathrm{C}_{16} \mathrm{H}_{25} \mathrm{NO}_{3} \mathrm{SSi}$ : C, $56.60 ; \mathrm{H}, 7.37$; N, 4.13. Found: C, $56.71 ; \mathrm{H}, 7.42 ; \mathrm{N}, 4.35 \%$.
tert-Butyldimethyl-prop-2-ynyloxy-silane $\mathbf{2 5 8}^{106}$

To a stirred solution of propargyl alcohol ( $2.00 \mathrm{~g}, 38 \mathrm{mmol}$ ) in tetrahydrofuran ( 40 mL ) was added imidazole ( $3.20 \mathrm{~g}, 46 \mathrm{mmol}$ ). After a clear solution was obtained, tertbutyldimethylsilyl chloride $(7.00 \mathrm{~g}, 46 \mathrm{mmol})$ was added to give a cloudy solution. The mixture was allowed to stir for 16 h at room temperature, then quenched with water ( 30 mL ) and diluted with dichloromethane ( 20 mL ). The organic layer was separated and washed with brine ( 30 mL ), then dried and evaporated to give the ynyloxy-silane $\mathbf{2 5 8}$ as a light yellow oil ( $6.45 \mathrm{~g}, 99 \%$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3314 (m), 2953 (s), 2933 (s), 2858 (s), 2118(w), 1472 (w), $1256(\mathrm{~m}), 1107(\mathrm{~s}), 836(\mathrm{~s})$ and $776(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.78\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right)$, $2.27(1 \mathrm{H}, \mathrm{t}, J 2.4, \mathrm{CH} \equiv)$ and $4.13\left(2 \mathrm{H}, \mathrm{d}, J 2.4,1-\mathrm{CH}_{2}\right) ; \delta_{\mathrm{C}}-5.2\left(2 \times \mathrm{SiCH}_{3}\right), 18.2(\mathrm{SiC}), 25.7$ $\left(3 \mathrm{xCH}_{3}\right), 51.5\left(1-\mathrm{CH}_{2}\right)$ and $72.9,82.4(\mathrm{C} \equiv \mathrm{C})$. These data are consistent with those recorded in the literature. ${ }^{106}$

## 1-O-tert-Butyldimethylsilyl-4-methyl-(4-methylphenylsulfonylamino)-hex-2-yne-1,4-diol

 259

To a stirred solution of the acetylene $\mathbf{2 5 8}(80 \mathrm{mg}, 0.46 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 1 mL ) at $-40^{\circ} \mathrm{C}$ was added $2.5 \mathrm{M} n$-butyl lithium ( 0.2 mL in haxanes, 0.46 mmol ) and the ketone 205 ( $50 \mathrm{mg}, 0.21 \mathrm{mmol}$ ) as described in general procedure method 2. After work-up, flash chromatography gave the acetylene $\mathbf{2 5 9}$ as a colourless solid ( $50 \mathrm{mg}, 59 \%$ ) and as a
mixture of diastereomers (55:45), mp $131-132^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.61(40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3346 (b), 3266 (b), 2930 (m), 2857 (m), 1598 (w), 1463 (w), 1331 (m), 1256 (m), 1163 (s), 1092 (s), 837 (s), $752(\mathrm{~m})$ and $666(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right)$, $0.80\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 0.93\left(1.65 \mathrm{H}, \mathrm{d}, J 6.7,6-\mathrm{CH}_{3 \mathrm{a}}\right), 0.98\left(1.35 \mathrm{H}, \mathrm{d}, J 6.7,6-\mathrm{CH}_{3 \mathrm{~b}}\right), 1.31$ $\left(1.65 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3 \mathrm{a}}\right), 1.33\left(1.35 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3 \mathrm{~b}}\right), 2.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.18-3.22(1 \mathrm{H}, \mathrm{m}, 5-\mathrm{H}), 4.17$ $\left(1.1 \mathrm{H}, \mathrm{s}, 1-\mathrm{CH}_{2 \mathrm{a}}\right), 4.21\left(0.9 \mathrm{H}, \mathrm{s}, 1-\mathrm{CH}_{2 \mathrm{~b}}\right), 4.94\left(0.55 \mathrm{H}, \mathrm{d}, J 9.9, \mathrm{NH}_{\mathrm{a}}\right), 5.06(0.45 \mathrm{H}, \mathrm{d}, J 9.9$, $\left.\mathrm{NH}_{\mathrm{b}}\right), 7.21-7.23(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{xArH})$ and 7.62-7.65 ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}$ ); $\delta_{\mathrm{C}}-5.1\left(2 \times \mathrm{SiCH}_{3}\right), 16.6$ $\left(\mathrm{CH}_{3}\right), 18.3(\mathrm{SiC}), 21.6\left(\mathrm{ArCH}_{3}\right), 25.8\left(3 \times \mathrm{CH}_{3}\right), 26.4\left(\mathrm{CH}_{3}\right), 51.6\left(1-\mathrm{CH}_{2}\right), 58.5(5-\mathrm{CH}), 70.5$ (4-C), 84.0, $85.0(\mathrm{C} \equiv \mathrm{C}), 127.1,129.9(4 \times \mathrm{ArCH})$ and 137.6, $143.7(2 \times \mathrm{ArC}) ; m / z[\mathrm{APcl}] 412$ $\left([\mathrm{M}+\mathrm{H}]^{+}, 25\right), 394(100)$; Found: $[\mathrm{M}+\mathrm{H}]^{+}, 412.1976 . \mathrm{C}_{20} \mathrm{H}_{34} \mathrm{NO}_{4} \mathrm{SSi}$ requires $M, 412.1972$.

## 1,2-Diphenyl-1-(4-methylphenylsulfonylamino)-but-3-yn-2-ol 262

To a solution of lithium acetylide-ethylenediamine ( $0.05 \mathrm{~g}, 0.45 \mathrm{mmol}$ ) in anhydrous dimethyl sulfoxide ( 1 mL ) at room temperature were added a solution of the ketone 260 (60 $\mathrm{mg}, 0.15 \mathrm{mmol})$ in anhydrous dimethyl sulfoxide ( 2 mL ) as described in general precedure method 1. After work-up, flash chromatography ( $40 \%$ ethyl acetate in petroleum ether) gave the acetylene 262 as a colourless solid ( $40 \mathrm{mg}, 67 \%$ ) and as a single diastereomer, mp 161$162^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.55$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] $3278(\mathrm{~m}), 2363(\mathrm{w})$, $1448(\mathrm{w}), 1325(\mathrm{~m}), 1159(\mathrm{~s}), 1090(\mathrm{~m})$ and $698(\mathrm{~s}) ; \delta_{\mathrm{H}} 2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.54(1 \mathrm{H}, \mathrm{s}$, $\mathrm{CH} \equiv), 4.51(1 \mathrm{H}, \mathrm{d}, J 8.6,1-\mathrm{H}), 5.34(1 \mathrm{H}, \mathrm{d}, J 8.6, \mathrm{NH}), 6.89-6.92(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x} \mathrm{ArH}), 7.02(2 \mathrm{H}$, $\mathrm{t}, J 7.7,2 \times \mathrm{ArH}), 7.15-7.19(4 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{ArH}), 7.26(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$ and $7.32(2 \mathrm{H}, \mathrm{dd}$, $J 7.7,1.5,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 20.1\left(\mathrm{ArCH}_{3}\right), 60.7(1-\mathrm{CH}), 71.2(\mathrm{C} \equiv), 81.4(2-\mathrm{C}), 84.2(\mathrm{C} \equiv), 125.3$, 125.8 ( $4 \times \mathrm{ArCH}$ ), 126.1 ( 2 x ArCH ), 126.5, 127.1 ( $2 \times \mathrm{ArCH}$ ), 128.4, 128.8 ( $4 \times \mathrm{ArCH}$ ), 128.9, ( $2 \times \mathrm{ArCH}$ ) and $136.2,139.2,140.1,143.0(4 \times \mathrm{ArC}) ; m / z[\mathrm{APcI}] 374$ ([M-OH] $\left.{ }^{+}, 100\right)$, 260 (30), 218 (70); Found $\left[M+\mathrm{NH}_{4}\right]^{+}, 409.1582 . \mathrm{C}_{23} \mathrm{H}_{25} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}$ requires $\mathrm{M}, 409.1580$.

## 1,2-Diphenyl-1-(4-methylphenylsulfonyl)-2-oct-3-yn-2ol 263

To a stirred solution of hexyne $225(0.03 \mathrm{~g}, 0.54 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 1 mL ) at $-40^{\circ} \mathrm{C}$ was added $2.5 \mathrm{M} n$-butyl lithium ( 0.22 mL in hexanes, 0.54 mmol ) and the ketone $260(0.10 \mathrm{~g}, 0.27 \mathrm{mmol})$ as described in general procedure method 2 . After work-up, flash chromatography ( $40 \%$ ethyl acetate in petroleum ether) gave the acetylene 264 as a yellow solid ( $70 \mathrm{mg}, 58 \%$ ) and as a single diastereomer, $\mathrm{mp} 168-169^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.44(40 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3274 (b), 3046 (m), 3334 (m), 2873 (w), 1692 (s), 1598 (m), 1450 ( s ), 1416 (m), 1320 (s), 1289 (s), 1161 (s), 1091 (m), 1026 (m), 812 (m), 701 (s) and $671(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.84\left(3 \mathrm{H}, \mathrm{t}, J 7.3, \mathrm{CH}_{3}\right), 1.19\left(2 \mathrm{H}\right.$, pent, $\left.J 7.3,7-\mathrm{CH}_{2}\right), 1.33(2 \mathrm{H}$, hex, $J 7.3,6-$ $\left.\mathrm{CH}_{2}\right), 1.45\left(2 \mathrm{H}, \mathrm{t}, J 7.3,5-\mathrm{CH}_{2}\right), 2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 4.43(1 \mathrm{H}, \mathrm{d}, J 8.1,1-\mathrm{CH}), 5.36(1 \mathrm{H}, \mathrm{d}$, $J 8.1, \mathrm{NH}), 6.89(2 \mathrm{H}, \mathrm{t}, J 8.1,2 \mathrm{xArH}), 6.97-7.03(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{xArH}), 7.05-7.15(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x}$ $\mathrm{ArH}), 7.22(2 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{ArH})$ and $7.33(2 \mathrm{H}, \mathrm{dd}, J 8.1,1.8, \mathrm{ArH}) ; \delta_{\mathrm{C}} 14.7\left(\mathrm{CH}_{3}\right), 19.1\left(\mathrm{CH}_{2}\right)$, $22.0\left(\mathrm{ArCH}_{3}\right), 22.7,31.0\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 67.4(1-\mathrm{CH}), 75.9(2-\mathrm{C}), 79.9$, $91.1(2 \times \mathrm{C} \equiv)$, 127.4, 127.5, 128.1, $128.7(8 \times \mathrm{ArCH}), 129.3(\mathrm{ArCH}), 129.5,129.8(4 \times \mathrm{ArCH}), 130.3(\mathrm{ArCH})$ and 134.6, 136.6, 141.5, 143.3 ( 4 x ArC ); $m / z$ [APcI] 430 ([M-OH] ${ }^{+}, 100$ ), 366 (10), 274 (15).

## 8-tert-Butyldimethylsilyloxy-1,2-diphenyl-1-(4-methyl-phenylsulfonyl)-oct-3-yn-2-ol 264

To a stirred solution of the acetylene $231(0.11 \mathrm{~g}, 0.55 \mathrm{mmol})$ in anhydrous tetrahydrofuran (1 mL ) at $-40^{\circ} \mathrm{C}$ was added $2.5 \mathrm{M} n$-butyl lithium ( 0.22 mL in hexanes, 0.55 mmol ) and the ketone $260(0.10 \mathrm{~g}, 0.27 \mathrm{mmol})$ as described in general procedure method 2. After work-up, flash chromatography ( $40 \%$ ethyl acetate in petroleum ether) gave the acetylene 264 as a yellow solid ( $38 \mathrm{mg}, 25 \%$ ), as a mixture of diastereomers ( $80: 20$ ) , mp $148-149^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.42$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3257 (b), 2928 (m), 2845 (m), 1450 (m), $1329(\mathrm{~m}), 1286(\mathrm{~m}), 1161(\mathrm{~s}), 1091(\mathrm{~s}), 1026(\mathrm{~m}), 835(\mathrm{~m})$ and $699(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00(6 \mathrm{H}, \mathrm{s}, 2$ x SiCH 3 ), $0.85\left(9 \mathrm{H}, \mathrm{s}, 3 \mathrm{x} \mathrm{CH}_{3}\right), 1.53-1.56\left(4 \mathrm{H}, \mathrm{m}, 6-\mathrm{and} 7-\mathrm{CH}_{2}\right), 2.22-2.26\left(5 \mathrm{H}, \mathrm{m}, 5-\mathrm{CH}_{2}\right.$ and $\left.\mathrm{ArCH}_{3}\right), 3.58\left(2 \mathrm{H}, \mathrm{br}, 8-\mathrm{CH}_{2}\right), 4.45\left(0.8 \mathrm{H}, \mathrm{d}, J 8.2,1-\mathrm{H}_{\mathrm{a}}\right), 4.47\left(0.2 \mathrm{H}, \mathrm{d}, J 8.2,1-\mathrm{H}_{\mathrm{b}}\right), 5.42$ $\left(0.8 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{NH}_{\mathrm{a}}\right), 5.45\left(0.2 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{NH}_{\mathrm{b}}\right), 6.78-6.90(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}), 6.92-6.98(2 \mathrm{H}$, $\mathrm{m}, 2 \mathrm{xArH}), 7.00-7.11(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{xArH}), 7.15-7.26(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{xArH})$ and 7.34-7.36(2H, m, $2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}-5.0\left(2 \times \mathrm{SiCH}_{3}\right), 18.2(\mathrm{SiC}), 19.1\left(\mathrm{CH}_{2}\right), 22.0\left(\mathrm{ArCH}_{3}\right), 25.7\left(3 \times \mathrm{CH}_{3}\right), 25.1$, $31.8\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 60.5(1-\mathrm{CH}), 64.6\left(\mathrm{CH}_{2}\right), 76.1(2-\mathrm{C}), 80.2,92.3(2 \times \mathrm{C} \equiv), 125.6,127.8,128.3$,
$128.9(8 \times \mathrm{ArCH}), 129.4(\mathrm{ArCH}), 129.6,130.4(4 \times \mathrm{ArCH}), 130.6(\mathrm{ArCH})$ and 138.2, 139.6, $140.1,143.8(4 \times \mathrm{ArC}) ; m / z[\mathrm{APcI}] 560\left([\mathrm{M}-\mathrm{OH}]^{+}, 25\right), 317$ (50), 186 (100).

## General Procedure for 5-Endo-Dig Iodocyclization Reactions.

The tosylamide 121 ( $1.3 \mathrm{mmol}, 1 \mathrm{eq}$.) was stirred in anhydrous acetonitrile ( 5 mL ) containing potassium carbonate ( $3.9 \mathrm{mmol}, 3 \mathrm{eq}$.) and cooled in an ice bath. Iodine ( $3.9 \mathrm{mmol}, 3 \mathrm{eq}$.) was added over 10 min and the resulting suspension stirred for 16 h at room temperature. Saturated aqueous sodium thiosulfate was then added until excess iodine was decolourized and the organic layer separated. The aqueous layer was extracted with dichloromethane ( $2 \times 5$ mL ) and the combined organic solutions dried and evaporated to give a crude hydroxydihydropyrrole 130, which was ready for elimination step.

## Elimination Method 1

To a solution of the crude dihydropyrrole $\mathbf{1 3 0}$ ( $1.3 \mathrm{mmol}, 1$ eq.) in dichloromethane ( 5 mL ) was added methanesulfonyl chloride ( $1.4 \mathrm{mmol}, 1.1$ eq.) dropwise at $0^{\circ} \mathrm{C}$, followed by triethylamine ( $1.56 \mathrm{mmol}, 1.2$ eq.) dropwise, and the resulting mixture stirred for 16 h . To the mixture was then added water ( 5 mL ) and the organic layer separated and dried. After evaporation, the crude iodopyrrole was purified by column chromatography ( $25 \% \mathrm{EtOAc}$ in petroleum ether) to give the iodopyrrole 131.

## Elimination Method 2

To a solution of the crude dihydropyrrole 130 ( $1.3 \mathrm{mmol}, 1$ eq.) in toluene ( 10 mL ) was added a catalytic amount of pyridinium $p$-toluenesulfonate ( 45 mg ) and the mixture refluxed for 16 h . The mixture then was diluted with diethyl ether ( 10 mL ) and washed with water ( 2 x 10 mL ). The organic layer was dried and concentrated to give a crude iodopyrrole. Column chromatography ( $25 \%$ EtOAc in petroleum ether) gave the iodopyrrole 131.

## Elimination Method 3

To a solution of the crude dihydropyrrole 130 ( $0.76 \mathrm{mmol}, 1$ eq.) in refluxing dichloromethane ( 5 mL ) was carefully added triethylamine ( $0.33 \mathrm{mmol}, 0.5$ eq.), followed by methanesulfonyl chloride ( $0.22 \mathrm{mmol}, 0.5$ eq.). After 5 minutes, the resulting mixture was allowed to cool to room temperature and then quenched with water ( 5 mL ). The organic layer was separated, washed with water, dried and evaporated to give the crude iodopyrrole, which was then purified by column chromatography ( $25 \%$ EtOAc in petroleum ether) gave the pure iodopyrrole 131.

Methyl (2SR,3RS)-5-butyl-3-hydroxy-4-iodo-1-(4'-methylphenylsulfonyl)-2,3-dihydro-pyrrole-2-carboxylate 267
And Methyl 5-butyl-4-iodo-1-(4-methylphenylsulfonyl)-pyrrole-2-carboxylate 268

The tosylamide $161(1.1 \mathrm{~g}, 3.0 \mathrm{mmol})$ in anhydrous acetonitrile ( 5 mL ) containing potassium carbonate ( $0.54 \mathrm{~g}, 3.9 \mathrm{mmol}$ ) was added iodine ( $1.0 \mathrm{~g}, 3.9 \mathrm{mmol}$ ) as described in the general procedure. After the work-up and evaporation, a crude hydroxy-dihydropyrrole 267 was obtained as brown oil $(1.30 \mathrm{~g}, 96 \%) ; \delta_{\mathrm{H}} 0.83\left(3 \mathrm{H}, \mathrm{t}, J 7.3, \mathrm{CH}_{3}\right), 1.20-1.26\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, 1.39-1.44 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{a}}$ ), $1.50-1.53\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{~b}}\right), 1.74(1 \mathrm{H}, \mathrm{br}, \mathrm{OH}), 2.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right)$, 2.41-2.46 $\left(1 \mathrm{H}, \mathrm{m}\right.$, pyr-CH ${ }_{2 \mathrm{a}}$ ), $2.64-2.68\left(1 \mathrm{H}, \mathrm{m}\right.$, pyr- $\left.\mathrm{CH}_{2 \mathrm{~b}}\right), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.39(1 \mathrm{H}, \mathrm{d}, J$ $1.4,2-\mathrm{H}), 4.58(1 \mathrm{H}, \mathrm{d}, J 1.4,3-\mathrm{H}), 7.29(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$ and $7.71(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x}$ $\mathrm{ArH}) ; \delta_{\mathrm{C}} 14.2\left(\mathrm{CH}_{3}\right), 22.0\left(\mathrm{CH}_{2}\right), 22.5\left(\mathrm{ArCH}_{3}\right), 29.8,30.0\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 53.4\left(\mathrm{OCH}_{3}\right), 70.1$ $(2(3)-\mathrm{CH}), 78.4(4-\mathrm{Cl}), 80.6(3(2)-\mathrm{CH}), 128.0(2 \times \mathrm{ArCH}), 130.3$ ( $2 \times \mathrm{ArCH}$ ), $134.5(5-\mathrm{C})$, 145.2, 149.7 ( $2 \times \mathrm{ArC}$ ) and $169.7(\mathrm{C}=\mathrm{O}$ );

## Method A

A solution of the crude dihydropyrrole $267(1.30 \mathrm{~g}, 3 \mathrm{mmol})$ in dichloromethane ( 5 mL ) was added methanesulfonyl chloride ( $0.26 \mathrm{~mL}, 3.3 \mathrm{mmol}$ ) and triethylamine ( $0.5 \mathrm{~mL}, 3.6 \mathrm{mmol}$ ) as described in the general elimination method 1 . After the work-up, the crude pyrrole was purified to give the iodopyrrole 268 as a light brown solid ( $1.0 \mathrm{~g}, 73 \%$ ).

## Method B

A solution of the crude dihydropyrrole $267(0.5 \mathrm{~g}, 1.4 \mathrm{mmol})$ in dichloromethane ( 5 mL ) in toluene ( 5 mL ) was added pyridinium $p$-toluenesulfonate $(0.04 \mathrm{~g}, 0.14 \mathrm{mmol})$ as described in the general elimination method 2. After the work-up, the crude pyrrole was purified to give the iodopyrrole 268 as a light brown solid ( $0.52 \mathrm{~g}, 81 \%$ ).

## Method C

The tosylamide $161(0.50 \mathrm{~g}, 1.40 \mathrm{mmol})$ was stirred in anhydrous acetonitrile ( 5 mL ) containing sodium hydrogen carbonate $(0.40 \mathrm{~g}, 4.25 \mathrm{mmol})$ and cooled in an ice bath. Iodine monobromide ( $0.88 \mathrm{~g}, 4.25 \mathrm{mmol}$ ) was added over 10 min and the resulting suspension stirred for 16 h at room temperature. Saturated aqueous sodium thiosulfate was then added until the mixture was decolourized and the organic layer separated. The aqueous layer was extracted with dichloromethane ( $2 \times 5 \mathrm{~mL}$ ) and the combined organic solutions dried and evaporated. The crude pyrrole was purified by column chromatography to give pyrrole 268 as a light brown solid ( $0.54 \mathrm{~g}, 84 \%$ ); $\mathrm{mp} 70-71^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.63$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2915 (w), 2855 (w), 1728 (s), 1589 (w), 1525 (s), 1467 (m), 1347 (m), 1178 (s), $758(\mathrm{~m}), 700(\mathrm{~m})$ and $661(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.83\left(3 \mathrm{H}, \mathrm{t}, J 7.2, \mathrm{CH}_{3}\right), 1.28\left(2 \mathrm{H}\right.$, hex, $\left.J 7.2, \mathrm{CH}_{2}\right), 1.37$ $\left(2 \mathrm{H}\right.$, pen, $\left.J 7.2, \mathrm{CH}_{2}\right), 2.37\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.78\left(2 \mathrm{H}, \mathrm{t}, J 7.2\right.$, pyr- $\left.\mathrm{CH}_{2}\right), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $6.80(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 7.27(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{ArH})$ and $7.86(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 12.6$ $\left(\mathrm{CH}_{3}\right), 20.6\left(\mathrm{CH}_{2}\right), 21.6\left(\mathrm{ArCH}_{3}\right), 27.9,30.6\left(2 \times \mathrm{CH}_{2}\right), 51.4\left(\mathrm{OCH}_{3}\right), 68.9(4-\mathrm{CI}), 125.6(3-$ CH ), 126.5 ( 2 x ArCH ), 127.3 (2(5)-C) 128.8, ( 2 x ArCH ), 135.2, 142.1, 144.3 (5(2)-C and 2 $\mathrm{x} \mathrm{ArC})$ and $159.4(\mathrm{C}=\mathrm{O}) ; m / z$ [APcI] $462\left([\mathrm{M}+\mathrm{H}]^{+}, 20\right), 430.1$ (100), 416 (70); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 462.0226 . \mathrm{C}_{17} \mathrm{H}_{21} \mathrm{INO}_{4} \mathrm{~S}$ requires $M, 462.0230$. Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{NO}_{4} \mathrm{~S}$ : C , 44.26; H, 4.34; N, 3.04. Found: C, 44.00; H, 4.53; N, 2.89\%.

## Methyl 4-iodo-1-(4-methylphenylsulfonyl)- 5-phenyl-pyrrole-2-carboxylate 275

The tosylamide $160(0.485 \mathrm{~g}, 1.34 \mathrm{mmol})$ in anhydrous acetonitrile ( 5 mL ) containing potassium carbonate ( $0.54 \mathrm{~g}, 3.9 \mathrm{mmol}$ ) was added iodine ( $1.0 \mathrm{~g}, 3.9 \mathrm{mmol}$ ) as described in the general procedure. After work-up, a crude hydroxy-dihydropyrrole $274(0.60 \mathrm{~g}, 98 \%)$ was obtained as brownish oil; $\delta_{\mathrm{H}} 1.70(1 \mathrm{H}, \mathrm{d}, J 8.4, \mathrm{OH}), 2.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.82(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 4.57(1 \mathrm{H}, \mathrm{dd}, J 8.4,1.6,3-\mathrm{H}), 4.84(1 \mathrm{H}, \mathrm{d}, J 1.6,2-\mathrm{H}), 7.08-7.39(9 \mathrm{H}, \mathrm{m}, 9 \mathrm{x} \mathrm{ArCH})$. To a solution of the crude dihydropyrrole 274 in dichloromethane ( 5 mL ) was added methanesulfonyl chloride ( $0.26 \mathrm{~mL}, 3.3 \mathrm{mmol}$ ) and triethylamine $(0.5 \mathrm{~mL}, 3.6 \mathrm{mmol})$ as described in the general procedure 1 . After the work-up, the product was purified to give the iododpyrrole 275 as a light brown solid ( $0.52 \mathrm{~g}, 83 \%$ ): mp $126-127^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.80$ ( $40 \%$ ethyl acetate in petroleum ether): $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2956 (s), 2855 (m), 1734 (s), 1594 (w), 1374 (m), $1178(\mathrm{~s}), 1091(\mathrm{~s}), 810(\mathrm{~m})$ and $668(\mathrm{~s}) ; \delta_{\mathrm{H}} 2.34\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.92$ $(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 7.03(2 \mathrm{H}, \mathrm{d}, J 7.9,2 \times \mathrm{ArH}), 7.11(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH}), 7.27(2 \mathrm{H}, \mathrm{t}, J 7.9,2 \times$ $\mathrm{ArH})$ and $7.34-7.39(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 22.1\left(\mathrm{ArCH}_{3}\right), 53.1\left(\mathrm{OCH}_{3}\right), 71.8(4-\mathrm{CI}), 126.1$ ( ArC ), 127.3 (3-CH), 128.1 ( $2 \times \mathrm{ArCH}$ ), 128.5 ( $2 \times \mathrm{ArCH}$ ), 129.0 ( ArCH ), 129.7 ( $2 \times \mathrm{ArCH}$ ), 130.8 (2(5)-C), $131.9(2 \times \mathrm{ArCH}), 135.6,142.2,145.8$ (5(2)-C and $2 \times \mathrm{ArC})$ and $161.8(\mathrm{C}=\mathrm{O})$; $m / z[\mathrm{APcI}] 482\left([\mathrm{M}+\mathrm{H}]^{+}, 15\right), 450.0$ (100), Anal. Calcd for $\mathrm{C}_{19} \mathrm{H}_{16}$ [NSO $4: \mathrm{C}, 47.40 ; \mathrm{H}, 3.30$; N, 2.90. Found: C, 47.62; H, 3.41; N, 2.71\%.

## Methyl

5-(3-benzyloxypropyl)-4-iodo-1-(4'-methylphenylsulfonyl)-pyrrole-2-carboxylate 295

The tosylamide 237 ( $100 \mathrm{mg}, 0.22 \mathrm{mmol}$ ) in anhydrous acetonitrile ( 5 mL ) containing potassium carbonate ( $91 \mathrm{mg}, 0.66 \mathrm{mmol}$ ) was added iodine ( $0.17 \mathrm{~g}, 0.66 \mathrm{mmol}$ ) as described
in the general procedure. After the work-up and evaporation, column chromatography ( $25 \%$ ethyl acetate in petroleum ether) gave the iodopyrrole 295 ( $83 \mathrm{mg}, 66 \%$ ) as a colourless solid; $\mathrm{mp} 109-110^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.30$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 2952 (m), 2925 (m), 1732 (s), 1714 (s), 1598 (w), 1488 (w), 1452 (m), 1373 (m), 1328 (m), 1313 (m), 1276 (s), 1172 (s), 1162 (s), 1112 (m), 1091 (s), 1070 (m), 1027 (m), 813 (w), 714 (m) and $668(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.98\left(2 \mathrm{H}\right.$, pen, $\left.J 6.3, \mathrm{CH}_{2}\right), 2.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.98\left(2 \mathrm{H}, \mathrm{t}, J 6.3\right.$, Pyr- $\left.\mathrm{CH}_{2}\right)$, $3.76\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.30\left(2 \mathrm{H}, \mathrm{t}, J 6.3, \mathrm{OCH}_{2}\right), 6.81(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 7.22(2 \mathrm{H}, \mathrm{d}, J 8.4,2 \mathrm{x} \mathrm{ArH})$, $7.38(2 \mathrm{H}, \mathrm{t}, J 7.4,2 \times \mathrm{ArH}), 7.50(1 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{ArH}), 7.85(2 \mathrm{H}, \mathrm{d}, J 8.4,2 \times \mathrm{ArH})$ and 8.03 $(2 \mathrm{H}, \mathrm{d}, J 7.4,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 21.8\left(\mathrm{ArCH}_{3}\right), 26.7,28.2\left(2 \times \mathrm{CH}_{2}\right), 52.4\left(\mathrm{OCH}_{3}\right), 64.2\left(\mathrm{OCH}_{2}\right)$, 70.5 (4-CI), 127.6 ( $2 \times \mathrm{ArCH}$ ), 128.2 (3-CH), 128.4 ( 2 x ArCH ), 128.8, 130.5, 136.3, 142.4, 145.9 (2(5)-C, ArCH and 3 x ArC ), 129.7, 129.9, ( 4 x ArCH ), 131.8 (5(2)-C) and 161.7, 167.9 (both $\mathrm{C}=\mathrm{O}$ ); $m / z$ [ APcI$] 568\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 441$ (15), 318 (20), 291 (20); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 568.0286 . \mathrm{C}_{23} \mathrm{H}_{23} \mathrm{INO}_{6} \mathrm{~S}$ requires $M, 568.0285$.

## Methyl (2SR,3RS)-5-t-butyl-3-hydroxy-4-iodo-1-(4'-methylphenylsulfonyl)-2,3-dihydro-pyrrole-2-carboxylate 296

The tosylamide $162(0.50 \mathrm{~g}, 1.4 \mathrm{mmol})$ was stirred in aqueous sodium hydrogen carbonate ( 5 mL ) and cooled in an ice bath. A solution of iodine ( $1.06 \mathrm{~g}, 4.2 \mathrm{mmol}$ ) in dichloromethane was added over 10 min and the mixture stirred for 16 h at room temperature. Saturated aqueous sodium thiosulfate was then added until excess iodine was decolourized and organic layer separated. The aqueous layer was extracted with dichloromethane ( $2 \times 5 \mathrm{~mL}$ ) and the combined organic solutions were dried and evaporated. Column chromatography gave the starting tosylamide $162(0.15 \mathrm{~g}, 25 \%)$ and the hydroxy-dihydropyrrole 296 as a colourless solid ( $0.34 \mathrm{~g}, 51 \%$ ), $\mathrm{mp} 122-123^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.54$ ( $30 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3478 (s), 2956 (m), 2915 (m), 1749 (m), 1443 (w), 1323 (m), 1156 (s), 1087 (m), 941 (w), $811(\mathrm{w})$ and $705(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.58\left(9 \mathrm{H}, \mathrm{s}, 3 \mathrm{xCH}_{3}\right), 2.48\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.67\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $4.30(1 \mathrm{H}$, app. s, $2(3)-\mathrm{H}), 4.39(1 \mathrm{H}$, app. s, $3(2)-\mathrm{H}), 7.38(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$ and $7.88(2 \mathrm{H}$, d, $J 8.2,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 22.0\left(\mathrm{ArCH}_{3}\right), 29.6\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 36.2(\mathrm{C}), 53.2\left(\mathrm{OCH}_{3}\right), 68.5 .85 .2(2-\mathrm{and}$ 3-CH), 89.1 (4-CI), 128.7, 130.4 (both $2 \times \mathrm{ArCH}$ ), 138.9, 145.6, 154.4 ( $5-\mathrm{C}$ and 2 x ArC ) and $168.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 462\left(\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 80\right), 406(100), 276(60)$.

## Methyl 5-tert-butyl-1-(4'-methylphenylsulfonyl)-pyrrole-2-carboxylate 299

To a solution of the crude 296 (2:1, dihydropyrrole 296 mixed with the tosylamide 162) in toluene ( 5 mL ) was added pyridinium $p$-toluenesulfonate ( 10 mg ) as decribed in general elimination method 2 . After work-up, column chromatography gave the dihydropyrrole 296, (51\%), and the pyrrole 299 as a brownish oil ( $47 \mathrm{mg}, 10 \%$ ), $\mathrm{R}_{\mathrm{f}} 0.67$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2924 (s), 2856 (s), 1732 (m), 1597 (w), 1494 (w), 1462 (s), $1376(\mathrm{~m}), 1313(\mathrm{~m}), 1263(\mathrm{w}), 1154(\mathrm{w})$ and $666(\mathrm{w}) ; \delta_{\mathrm{H}} 1.29\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.34(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 3.69\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.13(1 \mathrm{H}, \mathrm{d}, J 3.7,4-\mathrm{H}), 6.65(1 \mathrm{H}, \mathrm{d}, J 3.7,3-\mathrm{H}), 7.20(2 \mathrm{H}, \mathrm{d}, J$ 8.2, 2 x ArH ) and $7.60(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$; $\delta_{\mathrm{C}} 24.4\left(\mathrm{ArCH}_{3}\right), 31.3\left(3 \times \mathrm{CH}_{3}\right), 38.2(\mathrm{C})$, $55.5\left(\mathrm{OCH}_{3}\right), 116.4(3(4)-\mathrm{CH}), 117.8(4(3)-\mathrm{CH}), 119.5(2(5)-\mathrm{C}), 131.0,132.7$ (both 2 x $\mathrm{ArCH}), 136.4$ (5(2)-C), 148.0, $153.9(2 \times \mathrm{ArC})$ and $172.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 336\left([\mathrm{M}+\mathrm{H}]^{+}\right.$, 100), 244 (25); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 336.1266 . \mathrm{C}_{17} \mathrm{H}_{22} \mathrm{NO}_{4} \mathrm{~S}$ requires $M, 336.1264$

Methyl (2SR,3RS)-5-(t-butyldimethylsilyloxypropyl)-3-hydroxy-4-iodo-1-(4'-methylphenylsulfonyl)-2,3-dihydro-pyrrole-2-carboxylate 292 And Methyl 5-(t-butyldimethylsilyloxypropyl)-4-iodo-1-(4'-methylphenylsulfonyl)-pyrrole-2-carboxylate 294

The tosylamide $163(0.44 \mathrm{~g}, 0.94 \mathrm{mmol}$ ) in anhydrous acetonitrile ( 5 mL ) containing potassium carbonate $(0.39 \mathrm{~g}, 2.82 \mathrm{mmol})$ was added iodine $(0.72 \mathrm{~g}, 2.82 \mathrm{mmol})$ as described
in the general procedure. After work-up, a crude hydroxy-dihydropyrrole 292 was obtained as brownish oil ( $0.51 \mathrm{~g}, 91 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3518 (br), 2952 (s), 2856 (s), 1731 (s), 1591 (w), 1471 (m), 1378 (s), 1324 (m), 1252 (s), 1179 (s), 1159 (s), 1090 (s), 836 (s), 770 (m) and 667 (s); $\delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.83\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.52(1 \mathrm{H}, \mathrm{d}, J 7.9, \mathrm{OH}), 1.60-1.65(1 \mathrm{H}$, $\mathrm{m}, \mathrm{CH}_{2 \mathrm{a}}$ ), 1.80-1.84 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{~b}}$ ), $2.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.58-2.66\left(2 \mathrm{H}, \mathrm{m}\right.$, pyr- $\left.\mathrm{CH}_{2}\right), 3.50-$ $3.61\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2}\right), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.38(1 \mathrm{H}, \mathrm{dd}, J 7.9,1.5,3-\mathrm{H}), 4.56(1 \mathrm{H}, \mathrm{d}, J 1.5,2-$ $\mathrm{H}), 7.27(2 \mathrm{H}, \mathrm{d}, J 8.3, \mathrm{ArH})$ and $7.65(2 \mathrm{H}, \mathrm{d}, J 8.3, \mathrm{ArH}) ; \delta_{\mathrm{C}}-5.1\left(2 \times \mathrm{SiCH}_{3}\right), 18.3(\mathrm{C}), 21.5$ $\left(\mathrm{ArCH}_{3}\right), 26.0\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 26.8,44.0\left(2 \mathrm{xCH}_{2}\right), 53.0\left(\mathrm{OCH}_{3}\right), 62.1\left(\mathrm{OCH}_{2}\right), 69.7(2(3)-\mathrm{CH})$, 78.2 (4-CI), 80.3 (3(2)-CH), 127.2, 129.7 (both $2 \times \mathrm{ArCH}$ ), 133.9 (5-C), 144.8, 149.3 ( 2 x $\mathrm{ArC})$ and $169.2(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 596\left([\mathrm{M}+\mathrm{H}]^{+}, 5\right), 578\left(\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 35\right), 422(100)$; Found: $[\mathrm{M}+\mathrm{H}]^{+}, 596.0997 . \mathrm{C}_{22} \mathrm{H}_{35} \mathrm{INO}_{6} \mathrm{SSi}$ requires $M, 596.0994$.

To a solution of dihydropyrrole $292(0.45 \mathrm{~g}, 0.76 \mathrm{mmol})$ in refluxing dichloromethane ( 5 mL ) was added triethylamine $(0.2 \mathrm{~mL}, 0.33 \mathrm{mmol})$ and methanesulfonyl chloride $(0.35 \mathrm{~mL}, 0.35$ mmol ) as decribed in general elimination method 3 . After work-up, column chromatography gave the iodopyrrole 294 as pale yellow solid ( $0.22 \mathrm{~g}, 50 \%$ ); mp $74-75^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.62$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2953 ( s ), 2857 ( s ), 1732 ( s$), 1597(\mathrm{w}), 1472(\mathrm{~m})$, 1434 (m), 1379 (s), 1329 (m), 1300 (m), 1257 (s), 1180 (s), 1159 (s), 1092 (s), 958 (w), 837 (s), $771(\mathrm{~m})$ and $668(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.63-1.67(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 2.34\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.86-2.90\left(2 \mathrm{H}, \mathrm{m}\right.$, pyr- $\left.\mathrm{CH}_{2}\right), 3.59\left(2 \mathrm{H}, \mathrm{t}, J 6.0, \mathrm{OCH}_{2}\right), 3.74(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{OCH}_{3}\right), 6.79(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 7.26(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$ and $7.91\left(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH} ; \delta_{\mathrm{C}}-\right.$ $4.9\left(2 \times \mathrm{SiCH}_{3}\right), 18.3(\mathrm{C}), 21.7\left(\mathrm{ArCH}_{3}\right), 26.0\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 26.3,32.6\left(2 \times \mathrm{CH}_{2}\right), 52.4\left(\mathrm{OCH}_{3}\right)$, $62.6\left(\mathrm{OCH}_{2}\right), 70.0(4-\mathrm{CI}), 126.5(3-\mathrm{CH}), 127.4(2 \mathrm{x} \mathrm{ArCH}), 127.7(2(5)-\mathrm{C}), 130.9(2 \mathrm{x}$ $\mathrm{ArCH}), 136.0,142.5,145.3(5(2)-\mathrm{C}$ and 2 x ArC$)$ and $160.4(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 578\left([\mathrm{M}+\mathrm{H}]^{+}\right.$, 100), 422 (25); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 578.0885 . \mathrm{C}_{22} \mathrm{H}_{33} \mathrm{INO}_{5}$ SSi requires $M, 578.0888$.

## Methyl 5-(3'-hydroxypropyl)-4-iodo-1-(4-methylphenylsulfonyl)-pyrrole-2-carboxylate 293

To a solution of the crude $292(0.22 \mathrm{~g}, 0.37 \mathrm{mmol})$ in toluene ( 2 mL ) was added pyridinium $p$-toluenesulfonate ( 10 mg ) as decribed in general elimination method 2. After work-up, column chromatography ( $10-30 \%$ ethyl acetate in petroleum ether) gave the pyrrole 293 as a
colourless solid ( $37 \mathrm{mg}, 8 \%$ ); $\mathrm{mp} 125-126^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}} 0.27$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3355 (br), 2945 (w), 1729.9(s), 1596 (w), 1434 (m), 1368 (m), 1329 (m), $1178(\mathrm{~s}), 1090(\mathrm{~s}), 813(\mathrm{~m}), 756(\mathrm{w})$ and $666(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.77\left(2 \mathrm{H}\right.$, pen, $\left.J 7.1, \mathrm{CH}_{2}\right), 2.37(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 2.91\left(2 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{Pyr}-\mathrm{CH}_{2}\right), 3.64\left(2 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{OCH}_{2}\right), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.81(1 \mathrm{H}$, $\mathrm{s}, 3-\mathrm{H}), 7.27(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$ and $7.85(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 22.1\left(\mathrm{ArCH}_{3}\right), 26.2$, $32.8\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 52.9\left(\mathrm{OCH}_{3}\right), 62.5\left(\mathrm{OCH}_{2}\right), 70.7(4-\mathrm{Cl}), 127.0(2 \times \mathrm{ArCH}), 127.9(3-\mathrm{CH})$, 128.8 (2(5)-C), 130.2 ( $2 \times \mathrm{ArCH}$ ), 136.3, 142.4, 145.9 (5(2)-C and $2 \times \mathrm{ArC}$ ) and 160.7 ( $\mathrm{C}=\mathrm{O}$ ); $m / z$ [APcI] $464\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 308(50)$; Found: $[\mathrm{M}+\mathrm{H}]^{+}, 464.0024 . \mathrm{C}_{16} \mathrm{H}_{19} \mathrm{NO}_{5} \mathrm{~S}$ requires $M, 464.0023$.

## Methyl 5-(t-butyldimethylsilyloxybutyl)-4-iodo-1-(4'-methylphenylsulfonyl)-pyrrole-2carboxylate 284

The tosylamide $164(0.50 \mathrm{~g}, 1.0 \mathrm{mmol})$ in anhydrous acetonitrile ( 5 mL ) containing potassium carbonate $(0.41 \mathrm{~g}, 3.0 \mathrm{mmol})$ was added iodine $(0.77 \mathrm{~g}, 3.0 \mathrm{mmol})$ as described in the general procedure. After work-up, a crude hydroxy-dihydropyrrole was obtained as a brownish oil $(0.55 \mathrm{~g}, 92 \%)$. To a solution of the dihydropyrrole ( $0.45 \mathrm{~g}, 0.76 \mathrm{mmol}$ ) in refluxing dichloromethane ( 5 mL ) was added triethylamine ( $0.2 \mathrm{~mL}, 0.33 \mathrm{mmol}$ ) and methanesulfonyl chloride ( $0.35 \mathrm{~mL}, 0.35 \mathrm{mmol}$ ) as decribed in general elimination method 3. After work-up, column chromatography gave the iodopyrrole $284(0.38 \mathrm{~g}, 65 \%)$ as a colourless solid, mp 70 $71^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.57$ (40\% ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2953 (s), $2855(\mathrm{~s})$, 1737 (s), 1597 (w), 1472 (m), 1434 (m), 1378 (s), 1324 (m), 1249 (m), 1179 (s), 1093 (s), $1006(\mathrm{w}), 836(\mathrm{~s}), 776(\mathrm{~m})$ and $668(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.02\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right)$, $1.50-1.52\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right), 2.39\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.84\left(2 \mathrm{H}, \mathrm{t}, J 6.6, \mathrm{Pyr}^{2} \mathrm{CH}_{2}\right), 3.55(2 \mathrm{H}, \mathrm{t}, J$ $\left.6.6, \mathrm{OCH}_{2}\right), 3.77\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.83(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 7.29(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \mathrm{x} \mathrm{ArH})$ and $7.89(2 \mathrm{H}$, d, $J 8.3,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}}-5.2\left(2 \times \mathrm{SiCH}_{3}\right), 18.3(\mathrm{C}), 21.7\left(\mathrm{ArCH}_{3}\right), 26.0\left(3 \times \mathrm{CH}_{3}\right), 26.1,29.1$, $32.7\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 52.4\left(\mathrm{OCH}_{3}\right), 62.8\left(\mathrm{OCH}_{2}\right), 70.1(4-\mathrm{CI}), 126.6(3-\mathrm{CH}), 127.5,129.8$ (both 2 x $\mathrm{ArCH}), 128.3,136.1,142.9,145.3$ ( $2-, 5-\mathrm{C}$ and $2 \times \mathrm{ArC}$ ) and $160.4(\mathrm{C}=\mathrm{O}) ; m / z$ [APcI] 592 $\left([\mathrm{M}+\mathrm{H}]^{+}, 60\right), 436(100), 252(60)$; Found: $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 609.1306 . \mathrm{C}_{23} \mathrm{H}_{38} \mathrm{IN}_{2} \mathrm{O}_{5}$ SSi requires $M$, 609.1310 .

## General Precedure for Suzuki Reactions. ${ }^{45}$

118

280

A mixture of deoxygenated dimethylformamide and water ( $4: 1,2 \mathrm{~mL}$ ) was added to the iodopyrrole 118 ( $0.40 \mathrm{mmol}, 1 \mathrm{eq}$ ), $o$-nitrophenylboronic acid ( $0.1 \mathrm{~g}, 0.60 \mathrm{mmol}, 1.5 \mathrm{eq}$.), sodium carbonate ( 0.16 g ) and [1,1'-bis-(diphenylphosphino)ferrocene] dichloropalladium(II) ( $60 \mathrm{mg}, 0.08 \mathrm{mmol}, 0.2$ eq.). The mixture was heated for 2 h in an oil bath maintained at $80^{\circ} \mathrm{C}$ and then allowed to cool to room temperature. Ethyl acetate ( 2 mL ) and water ( 2 mL ) were added before filtration through celite. The separated organic phase was successively washed with water ( 5 mL ) and brine ( 5 mL ) and dried. After evaporation of the solvent, the residue was purified by flash chromatography using $25 \%$ ethyl acetate in petroleum ether to give the pyrrole 280.

Methyl 4-(2'-nitrophenyl)-5-phenyl-1-(4'-methylphenylsulfonyl)-pyrrole-2-carboxylate 281

A mixture of deoxygenated dimethylformamide and water ( $4: 1,2 \mathrm{~mL}$ ) was added to the iodopyrrole $275(0.20 \mathrm{~g}, 0.40 \mathrm{mmol})$, o-nitrophenylboronic acid ( $0.1 \mathrm{~g}, 0.60 \mathrm{mmol}$ ), sodium carbonate ( 0.16 g ) and [1, '-bis-(diphenylphosphino)-ferrocene] dichloropalladium(II) (60 $\mathrm{mg}, 0.08 \mathrm{mmol}$ ) as decribed in the general procedure. After work-up, flash chromatography ( $20-40 \%$ ethyl acetate in petroleum ether) gave the pyrrole 281 as a brownish oil ( 116 mg , $61 \%$ ), which crystallised to give colourless crystals; mp $151-152^{\circ} \mathrm{C}: \mathrm{R}_{\mathrm{f}} 0.80(40 \%$ ethyl acetate in petroleum ether): $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3063 (w), 2952 (w), 1729 (s), 1596 (w), 1526 (s), 1444 (w), 1373 (m), 1348 (m), 1275 (m), 1179 (s), 1125 (m), 1090 (w), 1046 (w), 854 (w) and $750(\mathrm{~m}) ; \delta_{\mathrm{H}} 2.31\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.82(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.85(2 \mathrm{H}, \mathrm{d}, J$ $8.4,2 \mathrm{x} \mathrm{ArH}), 6.92(1 \mathrm{H}, \mathrm{dd}, J 9.2,1.8, \mathrm{ArH}), 7.03-7.08(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x} \mathrm{ArH}), 7.17-7.19(1 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}), 7.25-7.29(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x} \mathrm{ArH})$ and $7.68(1 \mathrm{H}, \mathrm{dd}, J 9.2,1.8, \mathrm{ArCH}) ; \delta_{\mathrm{C}} 22.1\left(\mathrm{ArCH}_{3}\right), 53.1$

Methyl (2SR,3SR)-5-tert-butyl-3-hydroxy-4-(2'-nitrophenyl)-1-(4'-methylphenylsulfonyl)-2,3-dihydropyrrole-2-carboxylate 303

296

303

A mixture of deoxygenated dimethylformamide and water $(4: 1,5 \mathrm{~mL})$ was added to the tertbutyl dihydro-iodopyrrole 296 ( $105 \mathrm{mg}, 0.20 \mathrm{mmol}$ ), o-nitrophenylboronic acid ( $0.25 \mathrm{~g}, 1.5$ mmol ), and [1,1'-bis(diphenylphosphino)ferrocene]dichloropalladium(II) ( $1.5 \mathrm{~g}, 0.2 \mathrm{mmol}$ ) in the presence of sodium carbonate ( $74 \mathrm{mg}, 0.39 \mathrm{mmol}$ ) in place of sodium carbonate decahydrate as decribed in general procedure. After work-up, flash chromatography gave the hydroxy dihydropyrrole 303 ( $15 \mathrm{mg}, 15 \%$ ) as a bright yellow oil, $\mathrm{R}_{\mathrm{f}} 0.35$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3332 (br), 2960 (s), 2927 (s), 1732 (s), 1614 (w), 1594 (w), 1526 (m), 1455 (w), 1344 (m), 1318 (w), 1260 (m), 1150 (m), 1094 (w), 813 (w) and 672 (w); $\delta_{\mathrm{H}} 1.18\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.39\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.11(1 \mathrm{H}, \mathrm{d}, J 11.8, \mathrm{OH}), 3.72(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 4.23(1 \mathrm{H}, \mathrm{d}, J 1.2,2-\mathrm{H}), 4.53(1 \mathrm{H}, \mathrm{dd}, J 11.8,1.2,3-\mathrm{H}), 7.31(2 \mathrm{H}, \mathrm{d}, J 7.6,2 \times \mathrm{ArH})$, $7.38(1 \mathrm{H}, \mathrm{d}, J 7.8, \mathrm{ArH}), 7.49(1 \mathrm{H}, \mathrm{t}, J 7.8, \mathrm{ArH}), 7.62(1 \mathrm{H}, \mathrm{t}, J 7.8, \mathrm{ArH}), 7.88(2 \mathrm{H}, \mathrm{d}, J 7.6$, $2 \times \mathrm{ArH})$ and $8.15(1 \mathrm{H}, \mathrm{d}, J 7.8, \mathrm{ArCH})$;

## Methyl 5-tert-butyl-4-(2'-nitrophenyl)-1-(4'-methylphenylsulfonyl)-pyrrole-2-carboxylate

 304And Methyl 4-tert-butyl-5-(2'-nitrophenyl)-1-(4'-methylphenylsulfonyl)-pyrrole-2carboxylate 305

The dihydropyrrole 303 ( 15 mg ) underwent dehydration upon standing in deuteriochroloform over 10 h to give the pyrrole 304 ( $14 \mathrm{mg}, 99 \%$ ) as a yellow oil; $v_{\max } / \mathrm{cm}^{-1}$ [film] 3498 (w), 2956 (w), 1758 (m), 1594 (w), 1525 (s), 1433 (w), 1343 (s), 1284 (w), 1207 (w), 1164 (s), 1057 (w), 1016 (w), 811 (w) and $665(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.16\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.39\left(3 \mathrm{H}, \mathrm{ArCH}_{3}\right), 3.69$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.52(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 7.19-7.26(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{x} \mathrm{ArH}), 7.46(1 \mathrm{H}, \mathrm{t}, J 7.7, \mathrm{ArH}), 7.51$
$(1 \mathrm{H}, \mathrm{t}, J 7.7, \mathrm{ArH}), 7.77(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{ArH})$ and $7.93(1 \mathrm{H}, \mathrm{d}, J 7.7, \mathrm{ArH}) ; m / z[\mathrm{APcl}] 457$ $\left(\mathrm{M}^{+}+\mathrm{H}, 15\right), 391$ (100), 279 (15), 261 (15), 149 (15), 137 (20), 113 (30).

Rearrangement occurred during crystallization (in ethyl acetate/hexane for 30 days) to give the pyrrole 305 as a colorless solid, $\mathrm{mp} 135^{\circ} \mathrm{C}$; $\mathrm{v}_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3327 (b), 2976 (s), 2915 (s), 1734 (s), 1524 (s), 1453 (w), 1343 (w), 1318 (w), 1253 (w), 1197 (w), 1147 (m), 1092 (w), $1052(\mathrm{w})$ and $665(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.18\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.35\left(3 \mathrm{H}, \mathrm{ArCH}_{3}\right), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.18$ $(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{ArH}), 7.41(1 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{ArH}), 7.52(1 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{ArH}), 7.60(1 \mathrm{H}, \mathrm{t}, J 7.5$, $\mathrm{ArH}), 7.68(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \mathrm{x} \mathrm{ArH}), 8.14(1 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{ArH})$ and $9.22(1 \mathrm{H}, \mathrm{br}, 3-\mathrm{H}) ; m / z$ [APcI] $457\left(\mathrm{M}^{+}+\mathrm{H}, 100\right), 79(45)$.

## 2-Butyl-4-hexynyl-3-iodo-5-methyl-1-(4'-methylphenylsulfonyl)-pyrrole 306

To the tosylamide 251 ( $20.75 \mathrm{~g}, 53.3 \mathrm{mmol}$ ) in anhydrous acetonitrile ( 100 mL ) containing potassium carbonate ( $22.08 \mathrm{~g}, 160 \mathrm{mmol}$ ) was added iodine ( $40.60 \mathrm{~g}, 160 \mathrm{mmol}$ ) as described in the general procedure. The work-up and evaporation gave the pyrrole 306 as a brownish oil ( $17.70 \mathrm{~g}, 65 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.86$ ( $25 \%$ ethyl acetate in petroleum ether); $\nu_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2953 (s), 2856 (m), 1597 (w), 1453 (m), 1365 (s), 1252 (m), 1189 (s), 1089 (s), 1006 (w), $811(\mathrm{~m})$ and $705(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.83-0.91\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{3}\right), 1.30-1.51\left(8 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{CH}_{2}\right), 2.14(3 \mathrm{H}$, $\left.\mathrm{s}, 5-\mathrm{CH}_{3}\right), 2.32-2.37\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C} \equiv\right), 2.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.77-2.84\left(2 \mathrm{H}, \mathrm{m}\right.$, pyr- $\left.\mathrm{CH}_{2}\right)$, 7.19-7.22 ( $2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}$ ) and 7.43-7.53 ( $2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}$ ); $\delta_{\mathrm{C}} 14.3\left(2 \times \mathrm{CH}_{3}\right)$, 15.4 (5$\left.\mathrm{CH}_{3}\right), 19.6\left(\mathrm{CH}_{2}\right), 21.5\left(\mathrm{ArCH}_{3}\right), 22.3,23.0,30.0,31.2,32.7\left(5 \mathrm{x} \mathrm{CH}_{2}\right), 69.8(\mathrm{CI}), 74.4,96.1$ $(2 \times \mathrm{C} \equiv), 113.6,114.5(2 \times \mathrm{C}), 126.6(2 \times \mathrm{ArCH}), 130.5(2 \mathrm{xArCH})$ and 135.7, 137.0, 137.3, 145.4 ( $2 \times \mathrm{C}$ and $2 \times \mathrm{ArC}$ ); $m / z$ [APcI] 498 ( $[\mathrm{M}+\mathrm{H}]^{+}, 100$ ), 371 (30), 343 (35), 113 (65), 75 (100); Found $[\mathrm{M}+\mathrm{H}]^{+}, 498.0969 . \mathrm{C}_{22} \mathrm{H}_{29} \mathrm{NO}_{2} \mathrm{~S}$ requires $\mathrm{M}, 498.0964$.

## 2-Butyl-4-hexynyl-5-methyl-1-(4'-methylphenylsulfonyl)-3-vinyl-pyrrole 308

A mixture of the pyrrole $306(0.90 \mathrm{~g}, 1.81 \mathrm{mmol})$, vinyltributyltin ( $1.06 \mathrm{~mL}, 3.62 \mathrm{mmol}$ ) and bis-(triphenylphosphine)palladium(II) chloride ( $38.1 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) in toluene ( 18 mL ) was refluxed for 2 h . The mixture (color changed from yellow to black) was cooled to room temperature, diluted with dichloromethane $(80 \mathrm{~mL})$ and the resulting solution washed with brine ( 80 mL ) and water ( 80 mL ). The organic layer was separated, dried and evaporated. Column chromatography ( $0-10 \%$ ethyl acetate in petroleum ether) gave the pyrrole 308 as a yellow oil ( $74 \mathrm{mg}, 10 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.86$ ( $10 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2958 (s), 2930 (s), 2854 (m), 1597 (w), 1455 (m), 1365 (s), 1256 (m), 1179 (s), 1089 (s), $1008(\mathrm{~m}), 810(\mathrm{~m}), 705(\mathrm{~m})$ and $655(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.80-0.87\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{3}\right), 1.27-1.58(10 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2} \mathrm{C} \equiv$ and $\left.4 \times \mathrm{CH}_{2}\right), 2.31\left(3 \mathrm{H}, \mathrm{s}\right.$, pyr- $\left.\mathrm{CH}_{3}\right), 2.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.74-2.81(2 \mathrm{H}, \mathrm{m}$, pyr$\left.\mathrm{CH}_{2}\right), 5.14\left(1 \mathrm{H}, \mathrm{dd}, J 11.2,1.6, \mathrm{CH}_{2 \mathrm{a}}=\right.$ ), $6.05\left(1 \mathrm{H}, \mathrm{dd}, J 17.6,1.6, \mathrm{CH}_{2 \mathrm{~b}}=\right), 6.47(1 \mathrm{H}, \mathrm{dd}, J$ 17.6, 11.2, $\mathrm{CH}=$ ), 7.17-7.22 ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}$ ) and 7.44-7.46 ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}$ ); $\delta_{\mathrm{C}} 12.6,12.8$, $13.9\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 18.3\left(\mathrm{CH}_{2}\right), 20.6\left(\mathrm{ArCH}_{3}\right), 21.0,21.5,28.6,29.8,31.3\left(5 \mathrm{xCH}_{2}\right), 73.0,94.7$ ( $2 \times \mathrm{C} \equiv$ ), 106.2, $113.1(2 \times \mathrm{C}), 113.8\left(\mathrm{CH}_{2}=\right), 120.9(\mathrm{C}), 125.2(2 \times \mathrm{ArCH}), 126.4(\mathrm{CH}=)$, $129.1(2 \times \mathrm{ArCH})$ and $134.2,135.9,144.0(\mathrm{C}$ and 2 x ArC$) ; m / z[\mathrm{APcI}] 398\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$, 230 (15); Found $[\mathrm{M}+\mathrm{H}]^{+}, 398.2150 . \mathrm{C}_{24} \mathrm{H}_{32} \mathrm{NO}_{2} \mathrm{~S}$ requires M, 398.2148.

## Methyl 3-[2'-butyl-4'-hexynyl-5'-methyl-1'-(4''-methylphenylsulfonyl)-pyrrol-3-yl]-

 acrylate 310

A flask was charged with palladium(II) acetate $(0.02 \mathrm{~g}, 0.08 \mathrm{mmol})$ and triphenylphosphine $(0.13 \mathrm{~g}, 0.48 \mathrm{mmol})$, degassed overnight and flushed with nitrogen. Sodium acetate $(0.07 \mathrm{~g}$, $0.8 \mathrm{mmol})$, the pyrrole $306(0.20 \mathrm{~g}, 0.4 \mathrm{mmol})$ and methyl acrylate $309(0.05 \mathrm{~mL}, 0.5 \mathrm{mmol})$ were added. Following the addition of dimethylformamide ( 2 mL ), the flask was closed and,
the mixture stirred for 30 min at $120^{\circ} \mathrm{C}$ and then for 12 h at $150^{\circ} \mathrm{C}$. The mixture was then allowed to cool to room temperature. Ethyl acetate ( 2 mL ) and water ( 2 mL ) were added before filtration through celite. The separated organic phase was successively washed with water and brine and dried. After evaporation of the solvent, the residue was purified by flash chromatography using $10 \%$ ethyl acetate in petroleum ether to give the pyrrole 310 as a brownish oil ( $50 \mathrm{mg}, 30 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.45$ ( $10 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2970 (s), 2925 (s), 2855 (m), 1628 (w), 1433 (w), 1372 (m), 1283 (m), 1261 (m), 1171 ( s), $1091(\mathrm{~s}), 1017(\mathrm{~m}), 809(\mathrm{~m})$ and $655(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.81-0.89\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{3}\right), 1.18-1.53(10 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2} \mathrm{C} \equiv$ and $\left.4 \times \mathrm{CH}_{2}\right), 2.29\left(3 \mathrm{H}, \mathrm{s}\right.$, pyr- $\left.\mathrm{CH}_{3}\right), 2.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.85(2 \mathrm{H}, \mathrm{t}, J 7.9$, pyr$\left.\mathrm{CH}_{2}\right), 3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.38(1 \mathrm{H}, \mathrm{d}, J 16.0, \mathrm{CH}=), 6.91(1 \mathrm{H}, \mathrm{d}, J 16.0, \mathrm{CH}=), 7.21-7.28$ $(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH})$ and $7.44-7.47(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 13.7,13.8,14.0\left(3 \mathrm{CH}_{3}\right), 19.4\left(\mathrm{CH}_{2}\right)$, $21.7\left(\mathrm{ArCH}_{3}\right), 22.1,22.6,26.7,30.7,33.7\left(5 \times \mathrm{CH}_{2}\right), 51.5\left(\mathrm{OCH}_{3}\right), 72.8,95.8(2 \times \mathrm{C} \equiv)$, 105.8, 115.8 ( $2 \times \mathrm{C}$ ), 118.3 ( $\mathrm{CH}=$ ), 125.0 ( 2 x ArCH ), 127.9 (C), 128.9 ( $2 \times \mathrm{ArCH}$ ), 134.0 $(\mathrm{CH}=), 135.6,137.6,143.9(\mathrm{C}$ and $2 \times \mathrm{ArC})$ and $167.2(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 456\left([\mathrm{M}+\mathrm{H}]^{+}, 30\right)$, $390(15), 227(15), 137(100)$; Found $[M+H]^{+}, 456.2204 . \mathrm{C}_{26} \mathrm{H}_{34} \mathrm{NO}_{4} \mathrm{~S}$ requires $\mathrm{M}, 456.2203$.

## 2-Butyl-4-hexynyl-5-methyl-3-(2'-nitro-phenyl)-1-(4'-methylphenylsulfonyl)-pyrrole 311

A mixture of degassed dimethylfomamide and water ( $4: 1,5 \mathrm{~mL}$ ) was added to the iodopyrrole $306(0.50 \mathrm{~g}, 1 \mathrm{mmol})$, o-nitrophenyl boronic acid ( $0.2 \mathrm{~g}, 1.1 \mathrm{mmol}$ ), sodium carbonate decahydrate $(0.26 \mathrm{~g}, 2.5 \mathrm{mmol})$ and [1.1'-bis(diphenylphosphino)ferrocene] dichloropalladium(II) ( $73 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) as decribed in the general procedure for the Suzuki reaction. After work-up, flash chromatography ( $0-10 \%$ ethyl acetate in petroleum ether) gave the pyrrole 311 as a brownish oil $(0.30 \mathrm{~g}, 61 \%) ; \mathrm{R}_{\mathrm{f}} 0.90(10 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2968 (s), 2929 (s), 2865 (w), 1625 (w), 1523 (m), 1436 (w), 1370 (m), 1281 (m), $1260(\mathrm{~m}), 1174(\mathrm{~s}), 1092(\mathrm{~s}), 1021(\mathrm{~m}), 811(\mathrm{~m})$ and $668(\mathrm{~m}) ; \delta_{\mathrm{H}}$ 0.83-0.88 $\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{3}\right), 1.08-1.53\left(10 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C} \equiv\right.$ and $\left.4 \mathrm{xCH}_{2}\right), 2.34\left(3 \mathrm{H}, \mathrm{s}\right.$, pyr- $\left.\mathrm{CH}_{3}\right), 2.43(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{ArCH}_{3}\right), 2.80\left(2 \mathrm{H}, \mathrm{t}, J 7.6\right.$, pyr- $\left.\mathrm{CH}_{2}\right), 7.20-7.29(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{x} \mathrm{ArH}), 7.43-7.51(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{x}$ $\mathrm{ArH}), 7.65(1 \mathrm{H}, \mathrm{t}, J 8.6, \mathrm{ArH})$ and $8.17(1 \mathrm{H}, \mathrm{d}, J 8.6, \mathrm{ArCH}) ; \delta_{\mathrm{C}} 13.7,13.8,15.0\left(3 \times \mathrm{CH}_{3}\right)$,
$19.3\left(\mathrm{CH}_{2}\right), 21.7\left(\mathrm{ArCH}_{3}\right), 22.0,22.6,29.6,30.9,32.3\left(5 \times \mathrm{CH}_{2}\right), 74.0,95.7(2 \times \mathrm{C} \equiv), 106.1$, 114.3 ( $2 \times \mathrm{C}$ ), $123.5(\mathrm{ArCH}), 124.7$ (C), 126.3 ( $2 \times \mathrm{ArCH}$ ), 128.4 (C), 129.3 ( $2 \times \mathrm{ArCH}$ ), $130.1(2 \times \mathrm{ArCH}), 134.6(\mathrm{ArCH})$ and $135.3,136.7,136.9,145.0(\mathrm{C}$ and $3 \times \mathrm{ArC}) ; m / z[\mathrm{APcI}]$ $493\left([\mathrm{M}+\mathrm{H}]^{+}, 35\right), 477(20), 338(25), 176(100)$. The pyrrole was unstable as indicated by changing of the brown color to black over a few days at room temperature; the resulting sample showed no ${ }^{1} \mathrm{H}$ NMR data corresponding to the pyrrole 311. Keeping at low temperature is required!

## General procedure for silver-mediated cyclizations.

To a stirred solution of the tosylamide 314 ( $0.34 \mathrm{mmol}, 1 \mathrm{eq}$.$) in dichloromethane ( 2 \mathrm{~mL}$ ) was added $10 \% \mathrm{w} / \mathrm{w}$ silver nitrate on silica gel ( $290 \mathrm{mg}, 0.17 \mathrm{mmol}, 0.5 \mathrm{eq}$.) in the absence of light. After 16 hr , the mixture was filtered through a short plug of silica gel and the filtrate was evaporated to give the pyrrole 315 .

## 2,3-Dimethyl-1-(4'-methylphenylsulfonyl)-pyrrole 316

## Method A

To a stirred solution of the tosylamide 255 ( $90 \mathrm{mg}, 0.34 \mathrm{mmol}$ ) in dichloromethane ( 2 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel ( $290 \mathrm{mg}, 0.17 \mathrm{mmol}$ ) as described in general procedure. The work-up gave the pyrrole 49 as a colourless solid ( $63 \mathrm{mg}, 75 \%$ ), $\mathrm{mp} 59-60^{\circ} \mathrm{C}$.

## Method B

To a stirred solution of the tosylamide $257(51 \mathrm{mg}, 0.15 \mathrm{mmol})$ in dichloromethane ( 10 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel ( $1.24 \mathrm{~g}, 0.73 \mathrm{mmol}$ ) as described in general
procedure. The work-up gave the pyrrole 316 as a colourless solid ( $27 \mathrm{mg}, 72 \%$ ) $\mathrm{mp} 60^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}$ 0.94 (40\% ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] $2925(\mathrm{~m}), 1728(\mathrm{w}), 1596(\mathrm{w})$, $1362(\mathrm{~m}), 1250(\mathrm{~m}), 1183(\mathrm{~s}), 1163(\mathrm{~s}), 1092(\mathrm{~s}), 1026(\mathrm{~m}), 813(\mathrm{~m})$ and $685(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.82(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{CH}_{3}\right), 2.10\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.32\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 5.99(1 \mathrm{H}, \mathrm{d}, J 3.3,4-\mathrm{H}), 7.13(1 \mathrm{H}, \mathrm{d}, J 3.3,5-$ H), $7.21(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{ArH})$ and $7.57(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 10.8,11.2\left(2 \times \mathrm{CH}_{3}\right)$, $21.6\left(\mathrm{ArCH}_{3}\right), 113.9,120.6(4-$ and $5-\mathrm{CH}), 127.1(2 \times \mathrm{ArCH}), 129.9(2 \times \mathrm{ArCH})$ and 136.4 , 139.1, 143.5, 144.5 (all C); $m / z[\mathrm{APcI}] 250\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$.

## 5-(tert-Butyldimethylsilyloxymethyl)-2,3-dimethyl-1-(4'-methylphenylsulfonyl)-pyrrole 317

To a stirred solution of the tosylamide $259(9 \mathrm{mg}, 0.022 \mathrm{mmol})$ in dichloromethane ( 1 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel ( $20 \mathrm{mg}, 0.012 \mathrm{mmol}$ ) as described in general procedure. The work-up gave the pyrrole 317 as a colorless liquid ( $8 \mathrm{mg}, 93 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.88$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] $2932(\mathrm{~m}), 1728(\mathrm{w}), 1360(\mathrm{~m}), 1182(\mathrm{~s})$, $1093(\mathrm{~m}), 1057(\mathrm{~m}), 837(\mathrm{~m}), 779(\mathrm{~m})$ and $682(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.84(9 \mathrm{H}, \mathrm{s}, 3$ $\left.\mathrm{x} \mathrm{CH}_{3}\right), 1.80,2.10\left(6 \mathrm{H}, \mathrm{s}, 2-\mathrm{and} 3-\mathrm{CH}_{3}\right), 2.46\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 4.79\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 5.98(1 \mathrm{H}$, $\mathrm{s}, 4-\mathrm{H}), 7.16(2 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{ArCH})$ and $7.6(2 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{ArCH}) ; \delta_{\mathrm{C}}-0.5\left(2 \times \mathrm{SiCH}_{32}\right), 9.9$, $10.6\left(2-\right.$ and $\left.3-\mathrm{CH}_{3}\right), 20.3\left(\mathrm{ArCH}_{3}\right), 24.4\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 29.6(\mathrm{SiC}), 56.7\left(\mathrm{OCH}_{2}\right), 113.6(4-\mathrm{CH})$, 118.3 (5-C), 125.6 ( $2 \times \mathrm{ArCH}$ ), 126.4 (2(3)-C), 128.4 ( 2 x ArCH ), 133.6, 135.9 and 142.9 (3(2)-C and $2 \times \mathrm{ArC}) ; m / z[\mathrm{APcI}] 392\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 277(10), 262(100)$.

## 2,3-Diphenyl-1-(4-methylphenylsulfonyl)-pyrrole 318

To a stirred solution of the tosylamide $262(31 \mathrm{mg}, 0.08 \mathrm{mmol})$ in dichloromethane ( 1.5 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel ( $80 \mathrm{mg}, 0.04 \mathrm{mmol}$ ) as described in general procedure. The work-up gave the pyrrole 318 as a colourless solid ( $29.6 \mathrm{mg}, 100 \%$ ): mp 110-
$111^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.72$ (40\% ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2925 (w), 1597 (w), $1494(\mathrm{w}), 1447(\mathrm{w}), 1370(\mathrm{~m}), 1174(\mathrm{~s}), 1139(\mathrm{~s}), 769(\mathrm{~m})$ and $686(\mathrm{~s}) ; \delta_{\mathrm{H}} 2.28(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 6.48(1 \mathrm{H}, \mathrm{d}, J 3.4,4-\mathrm{H}), 6.95-6.98(4 \mathrm{H}, \mathrm{m}$, both 2 x ArH$), 7.00-7.04(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x}$ $\mathrm{ArCH}), 7.13-7.18(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x} \mathrm{ArH}), 7.25(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \mathrm{x} \mathrm{ArH})$ and $7.47(1 \mathrm{H}, \mathrm{d}, J 3.4,5-\mathrm{H})$; $\delta_{\mathrm{C}} 19.1\left(\mathrm{ArCH}_{3}\right), 109.54,120.2(4-, 5-\mathrm{CH}), 123.9(2 \mathrm{x} \mathrm{ArC}), 124.9,125.4,125.5,125.6(8 \mathrm{x}$ $\mathrm{ArCH}), 126.0$ ( 2 x ArCH ), 126.6 ( 2 x ArCH ), 127.8 (2(3)-C), 130.1 ( 2 x ArCH ), 131.8, 133.2, 142.0 (3(2)-C and both Ar-C); $m / z[\mathrm{APcI}] 374\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$.

## 5-Butyl-2,3-diphenyl-1-(4'-methylphenylsulfonyl)-pyrrole 319

To a stirred solution of the tosylamide $263(55 \mathrm{mg}, 0.12 \mathrm{mmol})$ in dichloromethane ( 10 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel $(1.2 \mathrm{~g}, 0.06 \mathrm{mmol})$ as described in general procedure. The work-up gave the pyrrole 319 as a colourless solid ( $53 \mathrm{mg}, 100 \%$ ); mp 104$105^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.68\left(40 \%\right.$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] $2956(\mathrm{~m}), 2860(\mathrm{~m})$, 1598 (m), 1536 (w), 1494 (w), 1451 (m), 1368 (s), 1305 (m), 1172 (s), 1094 (m), 1027 (m), $813(\mathrm{~m}), 765(\mathrm{~m})$ and $698(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.90\left(3 \mathrm{H}, \mathrm{t}, J 7.3, \mathrm{CH}_{3}\right), 1.40\left(2 \mathrm{H}\right.$, hex, $\left.J 7.3, \mathrm{CH}_{2}\right), 1.68$ ( 2 H , pen, $J 7.3, \mathrm{CH}_{2}$ ), $2.28\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.92(2 \mathrm{H}, \mathrm{t}, J 7.3$, pyr-CH 2$), 6.20(1 \mathrm{H}, \mathrm{s}, 4-\mathrm{H})$, $6.89(2 \mathrm{H}, \mathrm{d}, J 7.8,2 \times \mathrm{ArH})$ 6.98-7.06 ( $6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}$ ) and 7.12-7.24 ( $6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}$ ); $\delta_{\mathrm{C}}$ $14.1\left(\mathrm{CH}_{3}\right), 21.6\left(\mathrm{ArCH}_{3}\right), 22.6,29.2,31.6\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 113.1(4-\mathrm{CH}), 126.6(2 \mathrm{x} \mathrm{ArCH}), 127.0$ (ArC), 127.4, 127.9, 128.1, 129.4, 129.6 ( 10 x ArCH ), 131.8, 132.0 (2 x C), 132.5 ( 2 x $\mathrm{ArCH}), 134.5,136.9,138.7$ and 144.3 ( $4 \times \mathrm{C}$ ); $m / z[\mathrm{APcI}] 430$ ( $\left.[\mathrm{M}+\mathrm{H}]^{+}, 100\right)$.

## 5-[4'-(tert-Butyldimethylsilyloxy)butyl]-2,3-diphenyl-1-(4'-methylphenylsulfonyl)-pyrrole

 320

To a stirred solution of the tosylamide $264(32 \mathrm{mg}, 0.06 \mathrm{mmol})$ in dichloromethane ( 10 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel $(0.06 \mathrm{~g}, 0.03 \mathrm{mmol})$ as described in general procedure. The work-up gave the pyrrole $\mathbf{3 2 0}$ as a white solid ( $18 \mathrm{mg}, 58 \%$ ): mp $60-61^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}$ 0.62 ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2924 (s), $2860(\mathrm{~m}), 2854(\mathrm{~s})$, 1654 (w), 1604 (w), 1448 (m), 1378 (w), 1323 (w), 1263 (m), 1161 (m), 1092 (m), 735 (m), $695(\mathrm{~m})$ and $660(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.0\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{SiCH}_{3}\right), 0.84\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 1.60(2 \mathrm{H}$, pen, $J 6.7$, $\left.\mathrm{CH}_{2}\right), 1.75\left(2 \mathrm{H}\right.$, pen, $\left.J 6.7, \mathrm{CH}_{2}\right), 2.29\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.95(2 \mathrm{H}, \mathrm{t}, J 6.7$, pyr-CH$), 3.62(2 \mathrm{H}$, $\left.\mathrm{t}, J 6.7, \mathrm{OCH}_{2}\right), 6.22(1 \mathrm{H}, \mathrm{s}, 4-\mathrm{H}), 6.90(2 \mathrm{H}, \mathrm{dd}, J 8.0,1.8,2 \times \mathrm{ArH}), 7.01-7.05(8 \mathrm{H}, \mathrm{m}, 8 \mathrm{x}$ $\mathrm{ArH})$ and $7.17-7.22(4 \mathrm{H}, \mathrm{m}, \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{H}} 0.0\left(2 \times \mathrm{SiCH}_{3}\right), 17.4\left(\mathrm{CH}_{2}\right), 20.6\left(\mathrm{ArCH}_{3}\right), 24.5$ ( SiC ), $24.8\left(3 \times \mathrm{CH}_{3}\right), 28.2,31.6\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 62.0\left(\mathrm{OCH}_{2}\right), 112.1(4-\mathrm{CH}), 125.2(2 \times \mathrm{ArC})$, $125.9,126.1,126.9,127.1,127.9,128.0(12 \times \mathrm{ArCH}), 130.8$ (2(3)-C), $131.5(2 \mathrm{x} \mathrm{ArCH})$, and $133.4,135.8,137.3,143.2$ (2(3)-, 5-C and $2 \times \mathrm{ArC}) ; m / z[\mathrm{APcI}] 560\left([\mathrm{M}+\mathrm{H}]^{+}, 3\right), 444$ (25), 406 (100).

## 5-Butyl-3-hex-1-ynyl-2-methyl-1-(4-methylphenylsulfonyl)-pyrrole 321

To a stirred solution of the tosylamide $251(44 \mathrm{mg}, 0.11 \mathrm{mmol})$ in dichloromethane ( 10 mL ) was added $10 \% \mathrm{wt} / \mathrm{wt}$ silver nitrate on silica gel $(0.12 \mathrm{~g}, 0.06 \mathrm{mmol})$ as described in general procedure. The work-up gave the pyrrole 321 as a colourless solid ( $42 \mathrm{mg}, 100 \%$ ): mp 108$109^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.88$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 2959 (s), 2330 (s), 2871 (m), 1725 (w), 1597 (m), 1457 (m), 1365 (s), 1257 (m), 1191 (s), 1166 (s), 1093 (s), 812 $(\mathrm{m})$ and $686(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.83\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{3}\right), 1.28\left(2 \mathrm{H}\right.$, hex, $\left.J 7.4, \mathrm{CH}_{2}\right), 1.37(2 \mathrm{H}$, hex, $J 7.4$, $\left.\mathrm{CH}_{2}\right), 1.46-1.51\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right), 2.29\left(2 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{C} \equiv \mathrm{CCH}_{2}\right), 2.32,2.36\left(6 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right.$ and pyr- $\left.\mathrm{CH}_{3}\right), 2.66\left(2 \mathrm{H}, \mathrm{t}, J 7.4\right.$, pyr- $\left.\mathrm{CH}_{2}\right), 5.87(1 \mathrm{H}, \mathrm{s}, 4-\mathrm{H}), 7.23(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \times \mathrm{ArH})$ and $7.45(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 13.6,13.9,14.1\left(3 \times \mathrm{CH}_{3}\right), 19.0,19.2\left(2 \times \mathrm{CH}_{2}\right), 21.6$ $\left(\mathrm{ArCH}_{3}\right), 22.0,22.4,28.3,31.0\left(4 \mathrm{x} \mathrm{CH}_{2}\right), 73.9,93.0$ (both $\mathrm{C} \equiv$ ), 108 (2(3)-C), 113.0 (4-CH), $126.2(2 \mathrm{x} \mathrm{ArCH}), 129.9(2 \mathrm{x} \mathrm{ArCH})$ and 135.3, 136.6, 137.1, 144.6 (3(2)-, 5-C and $2 \times \mathrm{ArC}$ ); $m / z[\mathrm{APcI}] 372.0\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$.

## Ethyl (1,4-dioxa-spiro[4.5/dec-8-ylidene)-acetate 415 ${ }^{76 a}$

To a stirred suspension of sodium hydride $(0.40 \mathrm{~g}, 9.6 \mathrm{mmol}$, washed with 2 mL of anhydrous tetrahydrofuran), in anhydrous tetrahydrofuran ( 5 mL ) was added dropwise a solution of triethyl phophonoacetate ( $1.90 \mathrm{~mL}, 9.6 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 5 mL ) at room temperature and the resulting mixture stirred for 30 min . To the mixture, a solution of 1,4cyclohexanedione monoethylene ketal $415(1.00 \mathrm{~g}, 6.4 \mathrm{mmol})$ in tetrahydrofuran ( 1 mL ) was added dropwise and the mixture then stirred under reflux for 16 h . The cooled mixture was poured into cold water ( 15 mL ) and extracted with hexane ( $2 \times 10 \mathrm{~mL}$ ). The combined hexane extracts were washed with brine, dried and evaporated to give a crude product as a light yellow oil. The concentrated crude was purified by flash chromatography ( $25 \%$ ethyl acetate in petroleum ether) to give the ester 451 as a colourless oil ( $1.30 \mathrm{~g}, 90 \%$ ): $\mathrm{R}_{\mathrm{f}} 0.54$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2954 (s), 2858 (s), 1712 (s), 1648 (s), 1446 (m), 1364 (m), 1303 (m), 1274 (s), 1200 (s), 1168 (s), 1122 (s), 1088 (s), 1035 (s), 944 (m), 907 (s), $864(\mathrm{w})$ and $690(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.20\left(3 \mathrm{H}, \mathrm{t}, J 7.2, \mathrm{CH}_{3}\right), 1.70\left(4 \mathrm{H}, \mathrm{q}, J 6.4,2 \times \mathrm{CH}_{2}\right), 2.31(2 \mathrm{H}$, app. t, $\left.J 6.4, \mathrm{CH}_{2}\right), 2.93\left(2 \mathrm{H}\right.$, app. t, $\left.J 6.4, \mathrm{CH}_{2}\right), 3.91\left(4 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{OCH}_{2}\right), 4.10(2 \mathrm{H}, \mathrm{q}, J 7.2$, $\left.\mathrm{CO}_{2} \mathrm{CH}_{2}\right)$ and $5.60(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}=)$; $\delta_{\mathrm{C}} 14.7\left(\mathrm{CH}_{3}\right), 26.4,35.0,35.3,36.1\left(4 \times \mathrm{CH}_{2}\right), 60.0$ $\left(\mathrm{OCH}_{2}\right), 64.8\left(2 \times \mathrm{OCH}_{2}\right), 108.4(\mathrm{CH}=), 114.7(\mathrm{C}), 160.6(\mathrm{C}=)$ and $167.0(\mathrm{C}=\mathrm{O}) ; m / z$ [APcI] $227\left([\mathrm{M}+\mathrm{H}]^{+}, 25\right), 181$ (100). 2-(1',4'-Dioxa-spiro[4.5/dec-8'-ylidene)-ethanol $450{ }^{76 a}$

To a solution of the ester $451(1.00 \mathrm{~g}, 4.4 \mathrm{mmol})$ in dry toluene $(10 \mathrm{~mL})$ cooled to $-78^{\circ} \mathrm{C}$ was added Dibal-H ( $13.2 \mathrm{~mL}, 13.2 \mathrm{mmol}$ ) over a period of 20 minutes. After stirring for an additional 2 h , excess reagent was decomposed by the careful addition of $2 \mathrm{M} \mathrm{HCl}(20 \mathrm{~mL})$. The mixture was allowed to warm slowly to $0^{\circ} \mathrm{C}$ and the organic layer separated. The aqueous
layer was extracted with ethyl acetate ( $2 \times 20 \mathrm{~mL}$ ) and the combined organic fractions dried and evaporated to give the crude alcohol. The concentrated crude was purified by flash chromatography ( $25 \%$ ethyl acetate in petroleum ether) to give the alcohol $\mathbf{4 5 0}$ as a colourless oil ( $0.50 \mathrm{~g}, 62 \%$ ): $\mathrm{R}_{\mathrm{f}} 0.11$ ( $25 \%$ ethyl acetate in petroleum ether); $\nu_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3522 (br), 2944 (s), 2868 (s), 1671 (m), 1436 (m), 1364 (m), 1272 (m), 1122 (s), 1096 (s), 1068 (s), $1034(\mathrm{~s}), 944(\mathrm{~m}), 904(\mathrm{~s})$ and $683(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.63\left(4 \mathrm{H}\right.$, app. pen, $\left.J 6.3,2 \times \mathrm{CH}_{2}\right), 2.21(2 \mathrm{H}$, app. $\left.\mathrm{t}, J 6.3, \mathrm{CH}_{2}\right), 2.27\left(2 \mathrm{H}\right.$, app. t, $\left.J 6.3, \mathrm{CH}_{2}\right), 3.90\left(4 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{OCH}_{2}\right), 4.09\left(2 \mathrm{H}, \mathrm{d}, J 7.0,1-\mathrm{CH}_{2}\right)$ and $5.37(1 \mathrm{H}, \mathrm{t}, J 7.0, \mathrm{CH}=) ; \delta_{\mathrm{C}} 22.7,23.2,25.6,28.4(4 \mathrm{x} \mathrm{CH} 2), 41.5\left(1-\mathrm{CH}_{2}\right), 60.5(2 \mathrm{x}$ $\left.\mathrm{OCH}_{2}\right), 113.5(\mathrm{C}), 124.7(\mathrm{CH}=)$ and $134.4(\mathrm{C}=) ; m / z[\mathrm{APcI}] 167\left([\mathrm{M}-\mathrm{OH}]^{+}, 30\right), 122(100)$, 104 (95), 71 (50). ## 8-Ethyl-1,4-dioxa-spiro[4.5/decan-8-ol 419

To a stirred solution of the ethylmagnesium bromide ( 0.84 mL in diethyl ether, 6.4 mmol ) in anhydrous diethyl ether ( 10 mL ) was adding first half of the ketone ( $2.5 \mathrm{~g}, 1.6 \mathrm{mmol}$ ) solution in anhydrous diethyl ether ( 20 mL ). The mixture was allowed to stir for 3 h and then the second half of the ketone $415(2.5 \mathrm{~g}, 1.6 \mathrm{mmol})$ solution was added. The mixture was allowed to stir 2 h further, before heating at to reflux for 16 h . The resulting solution was allowed to cool to room temperature and poured into saturated aqueous ammonium chloride ( 25 mL ). The organic layer was then separated, dried and evaporated to give the crude product as a yellow oil. Column chromatography gave the alcohol 419 as a colourless oil ( $142 \mathrm{mg}, 30 \%$ ): $\mathrm{R}_{\mathrm{f}} 0.34$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3456 (br), 2930 (s), 2872 (m), $1438(\mathrm{w}), 1369(\mathrm{~m}), 1276(\mathrm{~m}), 1238(\mathrm{~m}), 1093(\mathrm{~s}), 1035(\mathrm{~m}), 942(\mathrm{~s})$ and $650(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.89$
$\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.48\left(2 \mathrm{H}, \mathrm{q}, J 7.5, \mathrm{CH}_{2}\right), 1.55-1.63\left(6 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2}\right), 1.83-2.18(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right)$ and 3.88-3.95 $\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}\right) ; \delta_{\mathrm{C}} 7.9\left(\mathrm{CH}_{3}\right), 30.9,34.6\left(4 \times \mathrm{CH}_{2}\right), 38.6\left(\mathrm{CH}_{2}\right), 64.6$ $\left(2 \times \mathrm{OCH}_{2}\right), 65.0(8-\mathrm{C})$ and $109.3(5-\mathrm{C}) ; \mathrm{m} / \mathrm{z}[\mathrm{APcI}] 169\left(\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 55\right), 125(100), 107(68)$, 89 (80), 73 (78).

## 8-Ethynyl-1,4-dioxa-spiro[4.5/decan-8-ol $420{ }^{107}$

To a stirred solution of lithium acetylide-ethylenediamine 254 ( $0.52 \mathrm{~g}, 5 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(10 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added a solution of the ketone $(0.45 \mathrm{~g}, 2.8 \mathrm{mmol})$ in tetrahydrofuran ( 5 mL ) slowly over 30 min . The mixture was then stirred at room temperature for 16 h . Saturated aqueous ammonium chloride ( 5 mL ) and diethyl ether ( 5 mL ) were added to the mixture, which was then stirred for 10 min . The aqueous layer was separated and extracted with ether ( $2 \times 10 \mathrm{~mL}$ ). The combined extracts were washed with water ( $3 \times 10$ mL ), dried and evaporated to give an orange oil. The oil was distilled under reduced pressure to give the alkynol $\mathbf{4 2 0}$ as a colourless oil $(0.31 \mathrm{~g}, 61 \%)$, bp $99-100^{\circ} \mathrm{C}$ at 0.03 mmHg [lit. $\mathrm{bp}^{107} 97-105^{\circ} \mathrm{C}$ at 0.03 mmHg$] ; \mathrm{R}_{\mathrm{f}} 0.49$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3404 (br), 2958 (s), 2890 (m), 2353 (w), 1443 (m), 1367 (m), 1334 (w), 1251 (m), 1162 (s), 1106 (s), 1033 (s), $999(\mathrm{~m}), 964(\mathrm{~s}), 882(\mathrm{w})$ and $733(\mathrm{w}) ; \delta_{\mathrm{H}} 1.62-1.65\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right)$, 1.68-1.77 ( $4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}$ ), $2.33(1 \mathrm{H}, \mathrm{s}, \mathrm{CH} \equiv)$ and $3.79\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}\right) ; \delta_{\mathrm{C}} 31.6737 .4(4$ x $\mathrm{CH}_{2}$ ), $64.7\left(2 \mathrm{x} \mathrm{OCH}_{2}\right), 66.3(8-\mathrm{C}), 66.3,88.7$ (both $\mathrm{C} \equiv \mathrm{C}$ ) and 108.2 (5-C); m/z [APcI] 183 $\left([\mathrm{M}+\mathrm{H}]^{+}, 15\right), 165(60), 125(100), 121(40), 79(25)$. These data are consistent with those recorded in the literature. ${ }^{107}$

## 8-Chloro-8-ethynyl-1,4-dioxa-spiro[4.5/decane 421,

 and 8-Ethynyl-1,4-dioxa-spiro[4.5]dec-7-ene 422

The alcohol $420(0.30 \mathrm{~g}, 1.6 \mathrm{mmol})$ was added to a stirred solution of thionyl chloride in 5 mL of dimethylformamide at room temperature. After the mixture was stirred for 3 h , it was treated with saturated aqueous ammonium chloride $(50 \mathrm{~mL})$ and diluted with ether ( 25 mL ). The organic layer was separated and dried. Removal of the solvent in vacuo gave a yellow oil. Column chromatography ( $10 \%$ ethyl acetate in petroleum ether) gave the chloro-acetylene 421 as a light yellow oil ( $113 \mathrm{mg}, 34 \%$ ): $\mathrm{R}_{\mathrm{f}} 0.38$ ( $10 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2958 (m), 2875 (w), 2359 (w), 1438 (w), 1367 (w), 1251 (m), 1163 (m), 1104 (s), $1033(\mathrm{~m})$ and $963(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.51-1.75\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right), 2.14-2.17\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right), 2.62$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{CH} \equiv)$ and $3.89\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}\right) ; \delta_{\mathrm{C}} 25.2,31.8\left(4 \times \mathrm{CH}_{2}\right), 55.7(8-\mathrm{CCl}), 66.3(2 \mathrm{x}$ $\left.\mathrm{OCH}_{2}\right), 69.1,86.1(2 \times \mathrm{C} \equiv)$ and $112.0(5-\mathrm{C})$.

Column chromatography ( $10 \%$ ethyl acetate in petroleum ether) also gave the enyne 422 as a colourless oil ( $102 \mathrm{mg}, 40 \%$ ): $\mathrm{R}_{\mathrm{f}} 0.57$ ( $10 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2961 (m), 2885 (m), 2367 (w), 1433 (m), 1367 (m), 1260 (m), 1115 (s), 1060 (s), 1042 (s), $948(\mathrm{~m}), 868(\mathrm{~m}), 798(\mathrm{w})$ and $735(\mathrm{~m}) ; \delta_{\mathrm{H}} 2.03\left(2 \mathrm{H}\right.$, app. $\left.\mathrm{t}, J 6.5, \mathrm{CH}_{2}\right), 2.51-2.66(4 \mathrm{H}, \mathrm{m}, 2$ $\left.\mathrm{x} \mathrm{CH}_{2}\right), 3.07(1 \mathrm{H}, \mathrm{s}, \mathrm{CH} \equiv), 4.23\left(4 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{OCH}_{2}\right)$ and $6.31-6.33(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}=) ; \delta_{\mathrm{C}} 20.5$ $\left(\mathrm{CH}_{2}\right), 38.2\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 67.1\left(2 \mathrm{x} \mathrm{OCH}_{2}\right), 79.8,83.1(2 \times \mathrm{C} \equiv), 117.1(5-\mathrm{C}), 132.7(8-\mathrm{C})$ and $136.9(\mathrm{CH}=) ; m / z[\mathrm{APcl}] 165\left([\mathrm{M}+\mathrm{H}]^{+}, 15\right), 137(15), 109(8), 89(100), 73(15)$.

## 3-Ethoxy-2-cyclohexen-1-one 426 ${ }^{69}$

In a three-necked, round-bottomed flask was placed a solution of 1,3-cyclohexanedione 412 ( $10.00 \mathrm{~g}, 89 \mathrm{mmol}$ ), $p$-toluenesulfonic acid monohydrate ( $0.30 \mathrm{~g}, 1.56 \mathrm{mmol}$ ) and absolute ethanol ( 50 mL ) in 200 mL of benzene. The mixture was heated to boiling and the azeotrope composed of benzene, alcohol and water was removed at the rate of 20 mL per hour. When the temperature of the distilling vapour reached $78^{\circ} \mathrm{C}(6 \mathrm{~h})$, the distillation was stopped and the residual solution was washed with $10 \%$ aqueous sodium hydroxide ( $4 \times 20 \mathrm{~mL}$ ), which had been saturated with sodium chloride. The resulting organic solution was washed with successive 10 mL portions of water until the aqueous washings were neutral, and then concentrated. The residual liquid was distilled under reduced pressure $\left(98-100^{\circ} \mathrm{C}\right.$ at 0.5 $\mathrm{mbar})^{69 \mathrm{c}}$ to give the ethoxy cyclohexenone 426 as a light brown liquid ( $6.54 \mathrm{~g}, 52 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2982 (m), 2947 (s), 2893 (m), 1651 (s), 1602 (s), 1475 (w), 1457 (m), 1429 (m), 1378
(s), 1349 (m), 1328 (s), 1221 (s), 1183 (w), 1136 (s), 1031 (m), 930 (m), 869 (m), 815 (s), 759 (w) and $658(\mathrm{w}) ; \delta_{\mathrm{H}} 1.44\left(3 \mathrm{H}, \mathrm{t}, J 7.0, \mathrm{CH}_{3}\right), 2.07\left(2 \mathrm{H}\right.$, app. pen, $\left.J 6.4,5-\mathrm{CH}_{2}\right), 2.42(2 \mathrm{H}$, app. $\left.\mathrm{t}, J 6.4,4(6)-\mathrm{CH}_{2}\right), 2.48\left(2 \mathrm{H}\right.$, app. t, $\left.J 6.4,6(4)-\mathrm{CH}_{2}\right), 3.98\left(2 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{OCH}_{2}\right)$ and $5.43(1 \mathrm{H}$, $\mathrm{s}, 2-\mathrm{H}) ; \delta_{\mathrm{C}} 14.5\left(\mathrm{CH}_{3}\right), 21.6,29.4,37.1\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 64.5\left(\mathrm{OCH}_{2}\right), 103.0(2-\mathrm{CH}), 178.3(3-\mathrm{C})$ and $200.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 141\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$. These data are consistent with those recorded in the literature. ${ }^{69 \mathrm{c}}$

## 3-Ethoxy-6-ethyl-cyclohex-2-enone 427 ${ }^{69}$

A dry, round-bottomed flask was charged with 40 mL of anhydrous tetrahydrofuran and anhydrous diisopropylamine ( $6.37 \mathrm{~mL}, 47 \mathrm{mmol}$ ). The flask was cooled to $0^{\circ} \mathrm{C}$ with an ice bath. A 2.5 M hexane solution of n-butyl lithium ( $18.8 \mathrm{~mL}, 47 \mathrm{mmol}$ ) was added dropwise with stirring over a $30-\mathrm{min}$ period. The resulting solution of lithium diisopropylamide (LDA) was cooled to $-78^{\circ} \mathrm{C}$. A solution of 3-ethoxy-2-cyclohexen-1-one $426(5.00 \mathrm{~g}, 36 \mathrm{mmol})$ in 25 mL of anhydrous tetrahydrofuran was added dropwise over a 1 h period. The solution was stirred at $-78^{\circ} \mathrm{C}$ for 1 h followed by the rapid addition of zinc chloride ( $4.90 \mathrm{~g}, 36 \mathrm{mmol}$ ) under a nitrogen flow. The addition of iodoethane $(8.7 \mathrm{~mL}, 107 \mathrm{mmol})$ and DMPU $(9.23 \mathrm{~g}, 72$ mmol ) followed. The resulting mixture was stirred at $-78^{\circ} \mathrm{C}$ for 2 h and then at room temperature for 16 h . The mixture was quenched with water $(50 \mathrm{~mL})$ and extracted with ether $(2 \times 50 \mathrm{~mL})$. The combined extracts were dried and evaporated to give a red-brown liquid. The concentrated crude was purified by flash chromatography to give the 3-ethoxy-6-ethylcyclohexenone 427 as a colourless oil ( $3.49 \mathrm{~g}, 57 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.56$ ( $30 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2974 (m), 2939 (m), 2885 (m), 1655 (s), 1610 (s), 1453 (w), 1423 (w), 1378 (s), 1354 (m), 1302 (w), 1217 (m), 1192 (s), 1107 (w), 1047 (w), 1022 (w), 901 (w), 841 (w) and $816(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.88\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.29\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{CH}_{3}\right), 1.37(1 \mathrm{H}$, hep, $J 6.9,6-$ $\mathrm{CH}), 1.62-1.71\left(1 \mathrm{H}, \mathrm{m}, 5-\mathrm{CH}_{2 \mathrm{a}}\right), 1.74-1.86\left(1 \mathrm{H}, \mathrm{m}, 5-\mathrm{CH}_{2 \mathrm{~b}}\right), 2.00-2.06\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.35$ $\left(2 \mathrm{H}\right.$, app. t, $\left.J 6.2,4-\mathrm{CH}_{2}\right), 3.81\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right)$ and $5.23(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{H}) ; \delta_{\mathrm{C}} 11.9,14.6(2 \mathrm{x}$ $\mathrm{CH}_{3}$ ), 22.8, 26.0, $28.3\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 46.9(6-\mathrm{CH}), 64.5\left(7-\mathrm{OCH}_{2}\right), 102.6(2-\mathrm{CH}), 177.1$ (3-C) and $202.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 169\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 71(40)$. These data are consistent with those recorded in the literature. ${ }^{69 \mathrm{c}}$

## 6-(1,2-Dichloro-vinyl)-3-ethoxy-6-ethyl-cyclohex-2-enone 428

Lithium diisopropylamide (LDA) was prepared from anhydrous diisopropylamine ( 2.70 mL , 19.7 mmol ) and a 2.5 M hexane solution of $n$-butyl lithium ( $7.90 \mathrm{~mL}, 19.7 \mathrm{mmol}$ ) in tetrahydrofuran ( 20 mL ) by using exactly the same method described in the foregoing experiment. The resulting solution of LDA was cooled to $-78^{\circ} \mathrm{C}$. A solution of the cyclohexenone $427(3.00 \mathrm{~g}, 17.9 \mathrm{mmol})$ in tetrahydrofuran ( 20 mL ) was added dropwise over 1-h period, followed immediately by the addition of hexamethylphosphorus triamide ( 3.25 $\mathrm{mL}, 17.9 \mathrm{mmol}$ ) over a $5-\mathrm{min}$ period. The resulting solution was stirred at $-78^{\circ} \mathrm{C}$ for 45 min , followed by the dropwise addition of trichloroethylene ( $1.80 \mathrm{~mL}, 19.7 \mathrm{mmol}$ ). The mixture was allowed to warm to room temperature slowly over 3 h . As the mixture warmed, the color changed from pale yellow to olive green, to pale red and finally to black. The mixture was then quenched with water ( 50 mL ) and organic layer was separated. The aqueous layer was extracted with diethyl ether ( $4 \times 15 \mathrm{~mL}$ ). The combined organic layers were washed with water ( $4 \times 45 \mathrm{~mL}$ ) and twice with brine ( 40 mL ) then dried and evaporated. The concentrated crude was purified by flash chromatography ( $20-40 \%$ ethyl acetate in petroleum ether) to give the 6-dichlorovinyl-6-ethyl-cyclohexenone 428 as a yellow oil ( $2.50 \mathrm{~g}, 53 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.80(40 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2938 (w), 1670 (m), 1611 (s), 1449 (w), $1379(\mathrm{~m}), 1240(\mathrm{w}), 1189(\mathrm{~s}), 1028(\mathrm{w})$ and $805(\mathrm{w}) ; \delta_{\mathrm{H}} 1.02\left(3 \mathrm{H}, \mathrm{t}, J 7.3, \mathrm{CH}_{3}\right), 1.38(3 \mathrm{H}, \mathrm{t}, J$ $\left.7.0, \mathrm{CH}_{3}\right), 1.86-1.97\left(3 \mathrm{H}, \mathrm{m}, 5-\mathrm{H}_{\mathrm{a}}\right.$ and $\left.\mathrm{CH}_{2}\right), 2.38\left(1 \mathrm{H}, \mathrm{dt}, J 17.6,5.3,5-\mathrm{H}_{\mathrm{b}}\right), 2.46-2.52(2 \mathrm{H}, \mathrm{m}$, $\left.4-\mathrm{CH}_{2}\right), 3.92\left(2 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{OCH}_{2}\right), 5.39(1 \mathrm{H}, \mathrm{s}, 2-\mathrm{H})$ and $6.39(1 \mathrm{H}, \mathrm{s}, \mathrm{CClH}) ; \delta_{\mathrm{C}} 9.8,14.6(2 \mathrm{x}$ $\left.\mathrm{CH}_{3}\right), 26.9,28.2,31.1\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 54.8(6-\mathrm{C}), 64.8\left(\mathrm{OCH}_{2}\right), 103.1(2-\mathrm{CH}), 116.7(\mathrm{CClH}), 136.9$ $(\mathrm{CCl}), 175.6(3-\mathrm{C})$ and $197.4(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 265\left([\mathrm{M}+\mathrm{H}]^{+}, 80\right), 263$ (95), 109 (25), 89

## 4-(1',2'-Dichloro-vinyl)-4-ethyl-cyclohex-2-enone 429

To a stirred solution of the cyclohexenone $428(0.50 \mathrm{~g}, 1.9 \mathrm{mmol})$ in anhydrous toluene ( 5 mL ) cooled to $0^{\circ} \mathrm{C}$, was added Dibal- $\mathrm{H}(2.3 \mathrm{~mL}, 2.3 \mathrm{mmol}$ ) during 1 h . After stirring for an additional 2 h at $0^{\circ} \mathrm{C}$, excess reagent was decomposed by the careful addition of methanol ( 5 mL ), followed by water ( 10 mL ) and then $10 \%$ aqueous sulfuric acid ( 15 mL ). The mixture was allowed to stir vigorously for 5 min and the organic layer separated. The aqueous layer was extracted with diethyl ether $(4 \times 10 \mathrm{~mL})$ and the combined organic fractions were washed with saturated sodium bicarbonate solution ( $2 \times 10 \mathrm{~mL}$ ), water ( $2 \times 10 \mathrm{~mL}$ ) and brine ( $2 \times 10$ $\mathrm{mL})$. The organic layers were then dried and evaporated. The concentrated crude was purified by distillation at $68-71^{\circ} \mathrm{C}$ ( 0.6 mbar ) to give the enone 429 as a colourless oil $(0.16 \mathrm{~g}, 42 \%)$; $v_{\max } / \mathrm{cm}^{-1}$ [film] 3068 (w), 2968 (m), 2925 (w), 2875 (w), 1687 (s), 1614 (w), 1459 (w), 1381 (w), 1254 (w), 1219 (w), 1113 (w), 874 (w), 824 (w) and $809(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.98\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right)$, 1.61-1.68 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}$ ), 1.88-1.97 (2H, m, $\mathrm{CH}_{2}$ ), 2.42-2.58 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 5.91(1 \mathrm{H}, \mathrm{d}, J 10.0$, $2(3)-\mathrm{H}), 6.54(1 \mathrm{H}, \mathrm{s}, \mathrm{CClH})$ and $7.19(1 \mathrm{H}, \mathrm{d}, J 10.0,3(2)-\mathrm{H}) ; \delta_{\mathrm{C}} 9.3\left(\mathrm{CH}_{3}\right), 24.4,25.2(2 \mathrm{x}$ $\left.\mathrm{CH}_{2}\right), 33.9(4-\mathrm{C}), 38.2\left(\mathrm{CH}_{2}\right), 112.7(\mathrm{CClH}), 127.3(2(3)-\mathrm{CH}), 143.6(7-\mathrm{CCl}), 147.1(3(2)-\mathrm{CH})$ and $197.9(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 221\left([\mathrm{M}+\mathrm{H}]^{+}, 20\right), 219(45), 183(100), 153$ (35), 61 (40); Found $\left[\mathrm{M}\left(\mathrm{Cl}^{35}\right)+\mathrm{NH}_{4}\right]^{+}, 236.0608 . \mathrm{C}_{10} \mathrm{H}_{16} \mathrm{Cl}_{2} \mathrm{NO}$ requires $M, 236.0609$.

## 8-(1',2'-Dichloro-vinyl)-8-ethyl-1,4-dioxa-spiro[4.5/dec-6-ene 425

A flask was charged with toluene ( 10 mL ), the cyclohexenone $429(0.16 \mathrm{~g}, 0.73 \mathrm{mmol})$, ethylene glycol ( $0.23 \mathrm{~mL}, 2.19 \mathrm{mmol}$ ) and $p$-toluenesulfonic acid (catalytic amount). After the mixture was refluxed for 16 h , it was poured into saturated sodium bicarbonate solution ( 5 mL ). The organic layer was separated and the aqueous layer extracted with diethyl ether ( 4 x 10 mL ). The organic phases were combined and washed with water ( $2 \times 10 \mathrm{~mL}$ ) and brine ( 10 $\mathrm{mL})$ then dried and evaporated to give the dioxolane 425 as a brownish oil ( $0.18 \mathrm{~g}, 100 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3473 (br), 3066 (w), 2964 (s), 2922 (s), 2880 (s), 1684 (s), 1609 (w), 1453 (m), 1378 (m), 1217 (m), 1107 (s), 1032 (m), 941 (m), 911 (m), $876(\mathrm{w})$ and $806(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.86$ $\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.46-1.53\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.75-1.81\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.18-2.46\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, 3.82-3.95 ( $4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}$ ), $5.55(1 \mathrm{H}, \mathrm{d}, J 10.4,6(7)-\mathrm{H}), 6.18(1 \mathrm{H}, \mathrm{d}, J 10.4,7(6)-\mathrm{H})$ and $6.30(1 \mathrm{H}, \mathrm{s}, \mathrm{CHCl}) ; \delta_{\mathrm{C}} 8.7\left(\mathrm{CH}_{3}\right), 31.2,32.0,32.6\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 34.3(8-\mathrm{C}), 64.8\left(2 \times \mathrm{OCH}_{2}\right)$,
$116.0(5-\mathrm{C}), 125.7(\mathrm{CHCl}), 127.7(6(7)-\mathrm{CH}), 135.9(7(6)-\mathrm{CH})$ and $143.1(\mathrm{CCl}) ; m / z$ [ APcl ] $265\left([\mathrm{M}+\mathrm{H}]^{+}, 25\right), 263(40), 229(35), 227(100), 219(20)$; Found $\left[\mathrm{M}\left(\mathrm{Cl}^{35}\right)+\mathrm{H}\right]^{+}, 263.0607$ for $\mathrm{C}_{12} \mathrm{H}_{17} \mathrm{Cl}_{2} \mathrm{O}_{2}$, calc. 263.0605.

## 8-Ethyl-8-ethynyl-1,4-dioxa-spirol4.5/dec-6-ene 430 69b

A stirred solution of the dichloro-decene $425(0.16 \mathrm{~g}, 0.61 \mathrm{mmol})$ in tetrahydrofuran was cooled to $-78^{\circ} \mathrm{C}$ under nitrogen. A 2.5 M hexane solution of $n$-butyl lithium $(0.50 \mathrm{~mL}, 1.22$ mmol ) was added dropwise over a $30-\mathrm{min}$ period. The mixture was allowed to stir at $-78^{\circ} \mathrm{C}$ for 2 h , the cold bath removed and stirring continued for 90 min . The mixture was poured into water ( 10 mL ) and the organic layer separated. The aqueous layer was extracted with diethyl ether ( $4 \times 10 \mathrm{~mL}$ ). The combined organic layers were washed with water ( $2 \times 10 \mathrm{~mL}$ ), brine ( 2 x 10 mL ) and dried. The concentrated crude was purified by flash chromatography ( $10 \%$ ethyl acetate in petroleum ether) to give the ethynyl-decene $\mathbf{4 3 0}$ as a colourless oil ( $60 \mathrm{mg}, 40 \%$ ); $\mathrm{R}_{\mathrm{f}}$ $0.50\left(10 \%\right.$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] $3490(\mathrm{br}), 3296(\mathrm{~s}), 3030(\mathrm{~m})$, 2962 (s), 2879 (s), 2105 (w), 1673 (m), 1461 (m), 1394 (s), 1348 (m), 1218 (s), 1156 (s), 1108 (s), $1022(\mathrm{~s}), 946(\mathrm{~s}), 884(\mathrm{~m})$ and $756(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.87-0.92\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3}\right), 1.41-1.51(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 1.58-1.63\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{a}}\right), 1.68-1.78\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{~b}}\right), 1.82-2.04\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH} \equiv\right.$ and $\left.\mathrm{CH}_{2}\right)$, 3.86-3.91 ( $4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}$ ), $5.44(1 \mathrm{H}, \mathrm{d}, J 9.9,6(7)-\mathrm{H})$ and $5.66(1 \mathrm{H}, \mathrm{d}, J 9.9,7(6)-\mathrm{H}) ; \delta_{\mathrm{C}}$ $9.1\left(\mathrm{CH}_{3}\right), 31.1,32.9,34.2\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 36.6(8-\mathrm{C}), 64.8,65.1\left(2 \mathrm{x} \mathrm{OCH}_{2}\right), 70.1,87.7(2 \times \mathrm{C} \equiv)$, $105.6(5-\mathrm{C}), 127.3(6(7)-\mathrm{CH})$ and $136.5(7(6)-\mathrm{CH}) ; m / z[\mathrm{APcI}] 193\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 137(25)$, 73 (35). These data are consistent with those recorded in the literature. ${ }^{69 b}$
(8'-Ethyl-1',4'-dioxa-spiro[4.5]dec-6'-en-8'-yl)-propynal 424

To a stirred solution of the dichloro-decene $425(0.16 \mathrm{~g}, 0.61 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 2 mL ) at $-78^{\circ} \mathrm{C}$ was added 2.5 M n-butyl lithium ( 0.5 mL in hexane, 1.22 mmol ) dropwise and then the mixture was allowed to stir at $-78^{\circ} \mathrm{C}$ for 2 h . To the mixture was added anhydrous dimethylformamide ( $0.1 \mathrm{~mL}, 1.22 \mathrm{mmol}$ ) in one portion. The reaction mixture was then warmed to room temperature and stirred for 1 h , then poured into a wellstirred mixture of $10 \%$ aqueous $\mathrm{KH}_{2} \mathrm{PO}_{4}(3 \mathrm{~mL}, 2.5 \mathrm{mmol})$ and diethyl ether $(3 \mathrm{~mL})$ at $5^{\circ} \mathrm{C}$ and this resulting mixture stirred vigorously for 10 min . The aqueous layer was separated and extracted by ether ( $2 \times 5 \mathrm{~mL}$ ). The combined ether solutions were then dried and evaporated to give the aldehyde 424 as a yellow oil $(0.12 \mathrm{~g}, 100 \%)$; $\mathrm{R}_{\mathrm{f}} 0.15$ ( $10 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3454 (br), 2956 (m), 2930 (m), 2867 (m), 2201 (m), 1666 (s), 1461 (w), $1383(\mathrm{w}), 1121(\mathrm{~m}), 1098(\mathrm{~m}), 1042(\mathrm{w}), 946(\mathrm{w})$ and $758(\mathrm{w}) ; \delta_{\mathrm{H}}$ 0.93-0.99 (3H, m, $\left.\mathrm{CH}_{3}\right)$, 1.44-1.67 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.70-1.83\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.91-2.02\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.80-3.97$ $\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2}\right), 5.59\left(1 \mathrm{H}, \mathrm{d}, J 10.0,6^{\prime}\left(7^{\prime}\right)-\mathrm{H}\right), 5.69\left(1 \mathrm{H}, \mathrm{d}, J 10.0,7^{\prime}\left(6^{\prime}\right)-\mathrm{H}\right)$ and $7.79(1 \mathrm{H}$, $\mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}} 9.2\left(\mathrm{CH}_{3}\right), 31.2,32.2,33.8\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 38.5(8 \mathrm{C}), 64.9,65.2\left(2 \mathrm{x} \mathrm{OCH}_{2}\right), 71.5$, 82.8 ( $2 \times \mathrm{C} \equiv$ ), 115.1 ( $\left.5^{\prime}-\mathrm{C}\right), 129.2\left(6^{\prime}\left(7^{\prime}\right)-\mathrm{CH}\right), 134.0\left(7^{\prime}\left(6^{\prime}\right)-\mathrm{CH}\right)$ and $176.9(\mathrm{C}=\mathrm{O}) ; \mathrm{m} / \mathrm{z}$ [APcI] $221\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 217(20), 72(35)$; Found $[\mathrm{M}+\mathrm{H}]^{+}, 221.1173 . \mathrm{C}_{13} \mathrm{H}_{17} \mathrm{O}_{3}$ requires $M$, 221.1172.

## Methyl (2SR,3SR)-5-(8'-ethyl-1',4'-dioxa-spiro[4.5/dec-6'-en-8'-yl)-3-hydroxy-2-(4-methylphenylsulfonylamino)-pent-4-ynoate 431 and Methyl (2SR,3SR)-5-(1'-Ethyl-4'-oxo-cyclohex-2'-enyl)-3-hydroxy-2-(4-methylphenylsulfonylamino)-pent-4-ynoate 432

Diisopropylamine ( $0.15 \mathrm{~mL}, 1.13 \mathrm{mmol}$ ) was suspended in anhydrous tetrahydrofuran ( 2 mL ) at $0^{\circ} \mathrm{C}$. A solution of $2.5 \mathrm{M} n$-butyllithium ( 1.12 mL in hexane, 1.13 mmol ) was added dropwise and the mixture stirred at $0^{\circ} \mathrm{C}$ for 30 min . The solution of lithium diisopropylamide thus formed was cooled to $-78^{\circ} \mathrm{C}$ and added a solution mixture of methyl $N$-tosyl glycine ester $1(0.11 \mathrm{~g}, 0.45 \mathrm{mmol})$ and $\operatorname{tin}(\mathrm{II})$ chloride ( $0.21 \mathrm{~g}, 1.13 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(5 \mathrm{~mL})$ as described in the general procedure. After the work-up, the product was purified to give the hydroxy ester 431 as a pale yellow oil ( $20 \mathrm{mg}, 10 \%$ ), anti:syn $=76: 24 ; \mathrm{R}_{\mathrm{f}} 0.1(40 \%$
ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3464 (b), 3256 (b), 2956 (m), 2865 (m), 2232 (s), 1745 (s), 1668 (s), 1437 (s), 1342 (s), 1163 (s), 1092 (s), 816 (s) and 668 (s); m/z [ APcI$] 464\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$; Found: $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 481.2005 . \mathrm{C}_{23} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{7} \mathrm{~S}$ requires $M, 481.2003$.

## Major Isomer:

$\delta_{\mathrm{H}} 0.89\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.29-1.60\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.63-1.98\left(4 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{CH}_{2}\right), 2.35(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 3.50\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.82-4.15\left(5 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{CH}_{2}\right.$ and $\left.2-\mathrm{H}\right), 4.57(1 \mathrm{H}, \mathrm{d}, J 5.1,3-\mathrm{H})$, 5.43-5.54 ( $2 \mathrm{H}, \mathrm{m}, 6^{\prime}\left(7^{\prime}\right)-\mathrm{H}$ and NH), $5.62\left(1 \mathrm{H}, \mathrm{dd}, J 10.0,2.7,7^{\prime}\left(6^{\prime}\right)-\mathrm{H}\right), 7.23(2 \mathrm{H}, \mathrm{d}, J 8.1$, $\mathrm{ArH})$ and $7.67(2 \mathrm{H}, \mathrm{d}, J 8.1, \mathrm{ArH}) ; \delta_{\mathrm{C}} 9.1\left(\mathrm{CH}_{3}\right), 21.9\left(\mathrm{ArCH}_{3}\right), 31.1,32.6,33.9\left(3 \times \mathrm{CH}_{2}\right)$, $36.7\left(5\right.$ '-C), $53.3\left(\mathrm{OCH}_{3}\right), 60.8(2-\mathrm{CH}), 63.4(3-\mathrm{CH}), 64.8,65.1\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 77.4,88.9(2 \mathrm{x}$ $\mathrm{C} \equiv$ ), $105.0\left(8^{\prime}-\mathrm{C}\right), 127.5\left(6^{\prime}\left(7^{\prime}\right)-\mathrm{CH}=\right), 127.7(2 \times \mathrm{ArCH}), 130.2$ ( $2 \times \mathrm{ArCH}$ ), 135.9 ( $7^{\prime}\left(6^{\prime}\right)-$ $\mathrm{CH}=), 136.9,144.1(2 \times \mathrm{ArC})$ and $168.7(\mathrm{C}=\mathrm{O})$.

## Minor Isomer:

The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 0.85\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 3.52(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right) ; \delta_{\mathrm{C}} 21.7\left(\mathrm{ArCH}_{3}\right), 31.0,32.3,33.7\left(3 \times \mathrm{CH}_{2}\right), 53.1\left(\mathrm{OCH}_{3}\right), 126.1\left(6^{\prime}\left(7^{\prime}\right)-\mathrm{CH}=\right)$ and 135.3 ( $\left.7^{\prime}\left(6^{\prime}\right)-\mathrm{CH}=\right)$. The ratio was calculated by careful integration of the resonance at $\delta_{\mathrm{H}}$ $3.52\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$.

Column chromatography of the previous crude product also gave the hydroxy ester 432 as a pale yellow oil ( $30 \mathrm{mg}, 14 \%$ ), anti $\mathrm{syn}=83: 17 ; \mathrm{R}_{\mathrm{f}} 0.45$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3343 (br), 2958 (m), 2860 (m), 2230 (m), 1744 (s), 1662 (s), 1597 (w), $1437(\mathrm{~m}), 1338(\mathrm{~s}), 1162(\mathrm{~s}), 1092(\mathrm{~s}), 813(\mathrm{~m})$ and $657(\mathrm{~s}) ; \mathrm{m} / \mathrm{z}[\mathrm{APcI}] 420\left([\mathrm{M}+\mathrm{H}]^{+}, 20\right), 79$ (100); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 420.1478 . \mathrm{C}_{21} \mathrm{H}_{26} \mathrm{NO}_{6} \mathrm{~S}$ requires $M, 420.1481$.

## Major Isomer:

$\delta_{\mathrm{H}} 0.85\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.51-1.64\left(2 \mathrm{H}, \mathrm{m}, 10^{\prime}-\mathrm{CH}_{2}\right), 1.72-2.12\left(4 \mathrm{H}, \mathrm{m}, 2 \mathrm{xCH}_{2}\right), 2.36$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.16-3.22(1 \mathrm{H}, \mathrm{br}, \mathrm{OH}), 3.40\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90-3.94(1 \mathrm{H}, \mathrm{m}, 2(3)-\mathrm{H}), 4.58-$ $4.70(1 \mathrm{H}, \mathrm{br}, 3(2)-\mathrm{H}), 5.58-5.62(1 \mathrm{H}, \mathrm{m}, \mathrm{NH}), 5.85(1 \mathrm{H}, \mathrm{d}, J 10.0,2$ '-H), $6.60(1 \mathrm{H}, \mathrm{d}, J 10.0$, $\left.3^{\prime}-\mathrm{H}\right), 7.24(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \mathrm{x} \mathrm{ArH})$ and $7.67(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 9.2\left(\mathrm{CH}_{3}\right), 22.0$ $\left(\mathrm{ArCH}_{3}\right), 33.5,33.8,35.1\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 37.1\left(1\right.$ '-C), $53.3\left(\mathrm{OCH}_{3}\right), 60.8,63.5$ (2- and 3-CH), 79.3, $88.7(2 \times \mathrm{C} \equiv), 127.7(2 \times \mathrm{ArCH}), 128.6(\mathrm{CH}=), 130.2(2 \mathrm{x} \mathrm{ArCH}), 136.4,144.6(2 \mathrm{x}$ $\mathrm{ArC}), 152.3(\mathrm{CH}=), 168.9(\mathrm{C}=\mathrm{O})$ and $199.2\left(4^{\prime}-\mathrm{C}=\mathrm{O}\right)$.

The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 0.84\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 6.79(1 \mathrm{H}, \mathrm{d}, J$ $\left.10.0,3^{\prime}-\mathrm{H}\right) ; \delta_{\mathrm{C}} 37.0\left(1^{\prime}-\mathrm{C}\right), 55.6\left(\mathrm{OCH}_{3}\right)$. The ratio was calculated by careful integration of the resonance at $\delta_{\mathrm{H}} 6.79\left(1 \mathrm{H}, \mathrm{d}, J 10.0,3^{\prime}-\mathrm{H}\right)$.

## 4'-Methoxybenzyl-2,2,2-trichloroacetimidate 440 ${ }^{108}$

To a suspension of sodium hydride ( $0.58 \mathrm{~g}, 14.5 \mathrm{mmol}$, prewashed by a minimum amount of diethyl ether) in diethyl ether ( 100 mL ) was added a solution of $p$-methoxybenzyl alcohol ( $20.0 \mathrm{~g}, 145 \mathrm{mmol}$ ) in diethyl ether $(100 \mathrm{~mL})$ at room temperature and stirring continued for 1 h. The mixture was cooled to $0^{\circ} \mathrm{C}$ and then trichloroacetonitrile ( $16 \mathrm{~mL}, 30 \mathrm{mmol}$ ) was added over 80 min . The mixture was then concentrated with the water bath temperature maintained below $40^{\circ} \mathrm{C}$. The residue was treated with a mixture of pentane ( 200 mL ) and methanol ( 5 mL ), stirred at room temperature for 30 min and filtered through a short plug of celite. Concentration gave the trichloroimidate 440 as a yellow oil ( $20.0 \mathrm{~g}, 50 \%$ ), which was suitable for further use.

## Ethyl 4-(4'-methoxybenzyloxy)-cyclohexanecarboxylate 441

## Method A

To a solution of sodium hydride $(1.40 \mathrm{~g}, 34.8 \mathrm{mmol}$, prewashed by minimum amount of tetrahydrofuran) in dimethylformamide ( 50 mL ) was added p-methoxybenzyl chloride 417 $(4.72 \mathrm{~mL}, 34.8 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ and stirring continued for 1 h . The resulting mixture was added to a solution of ethyl hydroxycyclohexane $417(5.00 \mathrm{~g}, 30 \mathrm{mmol})$ in tetrahydrofuran ( 50 mL ) and allowed to stir at room temperature for 16 h . The mixture was then poured into cold water $(100 \mathrm{~mL})$ and extracted with diethyl ether ( $2 \times 80 \mathrm{~mL}$ ). The combined organic layers were
washed with brine ( 100 mL ), dried and evaporated. The concentrated crude was purified by distillation at $200^{\circ} \mathrm{C}$ ( 0.1 mbar ) to give the 4-(4-methoxy-benzyloxy)-cyclohexanecarboxylate 441 as a light yellow oil $(1.02 \mathrm{~g}, 12 \%)$.

## Method B

A solution of the ethyl hydroxycyclohexane $417(5.00 \quad \mathrm{~g}, \quad 30 \mathrm{mmol})$ in dichloromethane/cyclohexane $(1: 2,50 \mathrm{~mL})$ was cooled to $0^{\circ} \mathrm{C}$ and treated with the crude trichloroimidate $440(10.00 \mathrm{~g}, 35 \mathrm{mmol})$ and pyridinium $p$-toluenesulfonate ( $0.38 \mathrm{~g}, 1.5$ mmol ) over 30 min . After 3 h , the mixture was warmed to room temperature, stirred over 48 h and concentrated. Filtration of the crude residue through a short plug of silica (using $20 \%$ ethyl acetate in petroleum ether) afforded the corresponding p-methoxybenzyloxy ether 441 as a pale yellow oil ( $7.55 \mathrm{~g}, 91 \%$ ); $\nu_{\text {max }} / \mathrm{cm}^{-1}$ [film] 2933 ( s , $2862(\mathrm{~m}), 1730(\mathrm{~s}), 1612(\mathrm{~m}), 1586$ (w), 1513 (s), 1454 (m), 1366 (w), 1248 (s), 1174 (s), 1086 (m), 1038 (m) and 821 (w); $\delta_{\mathrm{H}}$ 1.25-1.29 (3H, m, CH3 $)$, 1.31-1.68 (4H, m, $2 \times \mathrm{xH}_{2}$ ), 1.76-2.14 (4H, m, $2 \mathrm{xCH}_{2}$ ), 2.23-2.32 $\left(0.5 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}_{\mathrm{a}}\right), 2.34-2.43\left(0.5 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}_{\mathrm{b}}\right), 3.53(1 \mathrm{H}$, pen, $J 7.0,4-\mathrm{H}), 3.82\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 4.10-4.16 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2}\right)$, 4.46-4.49 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 6.86-6.89(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH})$ and 7.28$7.34(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 14.6\left(\mathrm{CH}_{3}\right), 24.3,37.6,29.5,31.7\left(4 \mathrm{xCH}_{2}\right), 43.2(1-\mathrm{CH}), 55.7$ $\left(\mathrm{OCH}_{3}\right), 61.8\left(\mathrm{OCH}_{2}\right), 70.4\left(\mathrm{OCH}_{2} \mathrm{Ar}\right), 74.8(4-\mathrm{CH}), 114.2(2 \mathrm{x} \mathrm{ArCH}), 129.5(2 \mathrm{x} \mathrm{ArCH})$, 132.1, 164.2 (both x ArC$)$ and $177.8(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 276\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$.

## Ethyl 1-ethyl-4-(4'-methoxybenzyloxy)-cyclohexanecarboxylate 439

Diisopropylamine ( $0.20 \mathrm{~mL}, 1.43 \mathrm{mmol}$ ) was dissolved in anhydrous tetrahydrofuran ( 2 mL ) at $0^{\circ} \mathrm{C}$ under nitrogen. A solution of 2.5 M n -butyl lithium ( 1.43 mL in hexane, 1.43 mmol ) was added dropwise and the solution stirred at $0^{\circ} \mathrm{C}$ for 30 min . The solution of lithium diisopropylamide thus formed was cooled to $-78^{\circ} \mathrm{C}$. To the resulting solution was added a solution of cyclohexanecarboxylate $441(0.33 \mathrm{~g}, 1.19 \mathrm{mmol})$ in tetrahydrofuran ( 3 mL ). After stirring at $-78^{\circ} \mathrm{C}$ for 10 min , ethyl bromide ( $0.2 \mathrm{~mL}, 3.39 \mathrm{mmol}$ ) was added dropwise over a 10 min period. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 1 h , then quenched by the addition of saturated aqueous ammonium chloride ( 5 mL ) and extracted with diethyl ether ( $2 \times 5 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 5 mL ), dried and evaporated to give the

1-ethyl cyclohexanecarboxylate 439 as a yellow oil ( $0.34 \mathrm{~g}, 94 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2936 (s), 2858 (m), 1724 (s), 1613 (m), 1586 ( w ), 1513 ( s$), 1462$ (m), 1368 (m), 1301 (m), 1248 (s), 1202 (s), 1172 (m), 1094 (s), 1036 (s), 926 (w), 821 (m) and $749(\mathrm{w}) ; \delta_{\mathrm{H}} 0.74(3 \mathrm{H}, \mathrm{t}, J 7.4$, $\left.\mathrm{CH}_{3}\right), 1.18\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{CH}_{3}\right), 1.23-1.46\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.48-1.56\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.48-1.56$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.82-1.91\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.14-2.23\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.16-3.28(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}), 3.73$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.08\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{CH}_{2}\right), 4.35-4.42\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 6.78-6.84(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x}$ $\mathrm{ArH})$ and 7.18-7.22 $(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 9.2,14.7\left(2 \mathrm{x} \mathrm{CH}_{3}\right), 27.7,29.0,29.9,32.3,34.2(5 \mathrm{x}$ $\left.\mathrm{CH}_{2}\right), 47.3(1-\mathrm{C}), 55.6\left(\mathrm{OCH}_{3}\right), 60.5\left(\mathrm{CH}_{2}\right), 69.8\left(\mathrm{OCH}_{2} \mathrm{Ar}\right), 72.8(4-\mathrm{CH}), 114.1(2 \times \mathrm{ArCH})$, $129.5(2 \times \mathrm{ArCH}), 131.5,159.4$ (both x ArC$)$ and $176.3(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 321\left([\mathrm{M}+\mathrm{H}]^{+}, 20\right)$, 184 (85), 137 (100).

## [1'-Ethyl-4'-(4-methoxy-benzyloxy)-cyclohexyl]-methanol 442

To a stirred solution of lithium aluminium hydride ( $3.00 \mathrm{~g}, 75 \mathrm{mmol}$ ) in anhydrous diethyl ether ( 20 mL ) cooled to $-78^{\circ} \mathrm{C}$, was added dropwise a solution of the cyclohexanecarboxylate $439(8.00 \mathrm{~g}, 25 \mathrm{mmol})$ in anhydrous diethyl ether ( 20 mL ). After stirring for an additional 2 h at $-78^{\circ} \mathrm{C}$, the mixture was slowly brought to room temperature over 30 min . The excess lithium aluminium hydride was decomposed by careful addition of ethyl acetate ( 2 mL ) followed by water ( 20 mL ) and $10 \%$ sulfuric acid $(20 \mathrm{~mL})$. The mixture was extracted with diethyl ether ( $3 \times 40 \mathrm{~mL}$ ). The combined organic fractions were dried and evaporated to give the crude alcohol. The concentrated crude was purified by flash chromatography ( $30-50 \%$ ethyl acetate in petroleum ether) to give the alcohol 442 as a colourless oil ( $0.50 \mathrm{~g}, 62 \%) ; \mathrm{R}_{\mathrm{f}}$ 0.30 ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3414 (br), 2930 (s), 2855 (s), 1612 (s), 1586 (w), 1513 (s), 1460 (m), 1367 (w), 1301 (m), 1248 (s), 1172 (m), 1085 (m), 1037 (s) and $822(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.75\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.06-1.27\left(5 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{a}}\right.$ and $\left.2 \mathrm{xCH}_{2}\right), 1.35-$ $1.47\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.49-1.57\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{~b}}\right), 1.67-1.74\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.28-3.33(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H})$, $3.45\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{OH}\right), 3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.37-4.41\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 6.79-6.84(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x}$ $\mathrm{ArH})$ and 7.19-7.22 $(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH})$; $\delta_{\mathrm{C}} 8.1\left(\mathrm{CH}_{3}\right), 27.3\left(\mathrm{CH}_{2}\right), 27.4,29.5,\left(4 \mathrm{x} \mathrm{CH}_{2}\right), 36.6$ $(1-\mathrm{C}), 55.7\left(\mathrm{OCH}_{3}\right), 65.8\left(\mathrm{CH}_{2} \mathrm{OH}\right), 69.8\left(\mathrm{OCH}_{2} \mathrm{Ar}\right), 75.6(4-\mathrm{CH}), 114.1,129.5(4 \mathrm{x} \mathrm{ArCH})$ and 131.6, 159.4 ( 2 x ArC ); $m / z$ [APcI] $279\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 121$ (100), 79 (60); Found: $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 296.2228 \mathrm{C}_{17} \mathrm{H}_{30} \mathrm{NO}_{3}$ requires $M, 296.2226$.

## 1-Ethyl-4-(4'-methoxy-benzyloxy)-cyclohexanecarbaldehyde 443

To a dried two-necked round bottom flask was added 0.5 g of $4^{\circ} \mathrm{A}$ molecular sieve, which had been dried at $110^{\circ} \mathrm{C}$ for 24 h . After the molecular sieves cooled down to room temperature under a nitrogen flow, pyridinium chlorochromate ( $0.43 \mathrm{~g}, 2.0 \mathrm{mmol}$ ) was added. The mixture was suspended in anhydrous dichloromethane ( 4 mL ), then cooled to $0^{\circ} \mathrm{C}$. The alcohol 442 ( $0.37 \mathrm{~g}, 1.33 \mathrm{mmol}$ ) in anhydrous dichloromethane ( 4 mL ) was added and the mixture was stirred for 16 h at room temperature, then filtered through a short plug of silica gel by using $10-60 \%$ diethyl ether in petroleum ether as eluant. The filtrate was then evaporated and dried in vacuo to dryness to give the aldehyde 443 as a light brown oil ( $0.33 \mathrm{~g}, 92 \%$ ) ; $\mathrm{R}_{\mathrm{f}} 0.76(25 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2936 (s), $2856(\mathrm{~m}), 1722(\mathrm{~s}), 1612(\mathrm{~m})$, 1586 (w), 1513 (s), 1463 (m), 1366 (w), 1301 (m), 1247 (s), 1173 (m), 1085 (s), 1036 (s) and $823(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.69\left(3 \mathrm{H}, \mathrm{t}, J 7.6, \mathrm{CH}_{3}\right), 1.14-1.26\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right), 1.37\left(2 \mathrm{H}, \mathrm{q}, J 7.6, \mathrm{CH}_{2}\right)$, 1.84-1.89 (2H, m, CH2 ), 2.01-2.05 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}$ ), 3.19-3.26 ( $1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}$ ), $3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $4.39\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 6.79(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \mathrm{xArH}), 7.18(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArH})$ and $9.34(1 \mathrm{H}$, $\mathrm{s}, \mathrm{CHO}) ; \delta_{\mathrm{C}} 8.6\left(\mathrm{CH}_{3}\right), 26.0,27.1,28.9,29.0,29.7\left(5 \mathrm{x} \mathrm{CH}_{2}\right), 50.0(1-\mathrm{C}), 55.7\left(\mathrm{OCH}_{3}\right), 69.8$ $\left(\mathrm{OCH}_{2} \mathrm{Ar}\right), 76.6(4-\mathrm{CH}), 114.1,129.5(4 \times \mathrm{ArCH}), 131.4,159.4(2 \times \mathrm{ArC})$ and 212.3 (CHO); $m / z[\mathrm{APcI}] 277\left([\mathrm{M}+\mathrm{H}]^{+}, 15\right), 140(100), 121$ (10).

## Dimethyl (1'-diazo-2'-oxo-propyl)-phosphonate 436 ${ }^{72}$

To a stirred suspension of sodium hydride ( $0.29 \mathrm{~g}, 12 \mathrm{mmol}$ ) in anhydrous benzene ( 100 mL ) and tetrahydrofuran $(20 \mathrm{~mL})$ cooled to $0-5^{\circ} \mathrm{C}$, was added dropwise a solution of dimethyl (2-oxopropyl)-phosphonate ( $2.0 \mathrm{~g}, 12 \mathrm{mmol}$ ) in anhydrous benzene ( 40 mL ). After stirring for 1 h at $0-5^{\circ} \mathrm{C}$, a solution of tosyl azide $(2.37 \mathrm{~g}, 12 \mathrm{mmol})$ in anhydrous benzene $(20 \mathrm{~mL})$ was added. The resulting mixture was warmed to room temperature and stirred for an additional 2
h. The mixture was filtered through a short plug of silica. The filtrate was concentrated and the residue purified by flash chromatography ( $20-50 \%$ ethyl acetate in petroleum ether) to give the diazo ester 436 as a colourless oil ( $1.92 \mathrm{~g}, 84 \%$ ), which was suitable for further use; $\mathrm{R}_{\mathrm{f}} 0.09\left(40 \%\right.$ ethyl acetate in petroleum ether); $\delta_{\mathrm{H}} 2.20\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.77\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{OCH}_{3}\right)$; $m / z[\mathrm{APcl}] 193\left(\left[\mathrm{M}+\mathrm{H}^{+}, 75\right), 165(100), 133(60), 109(55)\right.$. These data are consistent with those recorded in the literature. ${ }^{72}$

## 1-Ethyl-1-ethynyl-4-(4'-methoxyphenyloxy)-cyclohexane 444

To a stirred mixture of the aldehyde $443(0.33 \mathrm{~g}, 1.2 \mathrm{mmol})$ and potassium carbonate $(0.33 \mathrm{~g}$, 2.4 mmol ) in dry methanol ( 30 mL ) was added the phosphonate $444(0.69 \mathrm{~g}, 3.6 \mathrm{mmol})$ and stirring was continued until the reaction was complete as indicated by TLC. After 24 h , the mixture was diluted with diethyl ether ( 50 mL ), washed with aqueous sodium bicarbonate solution (5\%) and dried. Evaporation of the solvent yielded the ethynyl-cyclohexyloxy ether 444 as a light yellow oil $(0.31 \mathrm{~g}, 95 \%) ; \mathrm{R}_{\mathrm{f}} 0.79$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3295 (m), 2934 (s), 2852 (m), 2105 (w), 1612 (w), 1513 (s), 1462 (m), 1364 (w), 1301 (w), 1247 (s), 1172 (w), 1090 (m), 1036 (m) and $823(\mathrm{w}) ; \delta_{\mathrm{H}} 0.93(3 \mathrm{H}, \mathrm{t}, J 7.4$, $\left.\mathrm{CH}_{3}\right), 1.00-1.11\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.32-1.41\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.62-1.81\left(4 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{CH}_{2}\right), 1.87-1.93$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.08(1 \mathrm{H}, \mathrm{s}, \mathrm{CH} \equiv), 3.16-3.21(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}), 3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.43(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{2} \mathrm{Ar}\right), 6.80(2 \mathrm{H}, \mathrm{d}, J 8.5,2 \times \mathrm{ArH})$ and $7.25(2 \mathrm{H}, \mathrm{d}, J 8.5,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 9.4\left(\mathrm{CH}_{3}\right), 27.2$, 29.3, 32.0, 35.8, $35.8\left(5 \mathrm{x} \mathrm{CH}_{2}\right), 36.9(1-\mathrm{C}), 55.7\left(\mathrm{OCH}_{3}\right), 69.3(\mathrm{C} \equiv), 69.9\left(\mathrm{OCH}_{2} \mathrm{Ar}\right), 71.3(4-$ $\mathrm{CH}), 88.7(\mathrm{C} \equiv), 114.1,129.5(4 \mathrm{x} \mathrm{ArCH})$ and 132.5, 158.1 ( 2 x ArC ); $m / z$ [APcI] 273 $\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 243(20), 137(90)$.

The acetylene $444(0.3 \mathrm{~g}, 1.1 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 3 mL ) at $-40^{\circ} \mathrm{C}$ was reacted $n$-butyl lithium ( 4.4 mL of a 2.5 M solution in hexane, 1.1 mmol ) dropwise anhydrous dimethylfomamide ( $0.2 \mathrm{~mL}, 2.2 \mathrm{mmol}$ ) according to the general procedure of the preparation of acetylene aldehydes (page 150). Work-up yielded the propynal 445 as a brownish oil ( 0.33 $\mathrm{g}, 100 \%$ ), bp $210^{\circ} \mathrm{C}$ at $0.09 \mathrm{mbar} ; v_{\max } / \mathrm{cm}^{-1}$ [film] $2936(\mathrm{~s}), 2858(\mathrm{~s}), 2202(\mathrm{~s}), 1665(\mathrm{~s}), 1612$ (s), 1513 (s), 1462 (s), 1365 (s), 1248 (s), 1172 (s), 1072 (m), 1035 (s) and 821 (s); $\delta_{\mathrm{H}} 0.93$ $\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.15-1.20\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.41-1.47\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.57-1.61\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, 1.89-1.95 (3H, m, CH2 $), 3.20-3.23(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}), 3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.42\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 6.81$ $(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{ArH}), 7.12(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{ArH})$ and $9.32(1 \mathrm{H}, \mathrm{s}, 1-\mathrm{H}) ; \delta_{\mathrm{C}} 9.1\left(\mathrm{CH}_{3}\right), 26.9$, 29.1, 31.0, 34.5, $34.8\left(5 \mathrm{x} \mathrm{CH}_{2}\right), 37.5(1$ '- C$), 55.3\left(\mathrm{OCH}_{3}\right), 69.6\left(\mathrm{OCH}_{2}\right), 76.5(4$ ' CH$), 84.2$, 103.2 ( $2 \times \mathrm{C} \equiv$ ), 113.7, 129.1 ( $4 \times \mathrm{ArCH}$ ), 130.8, 159.1 ( 2 x ArC ) and 177.2 ( $\mathrm{C}=\mathrm{O}$ ); $m / z[\mathrm{APcl}]$ $301\left([\mathrm{M}+\mathrm{H}]^{+}, 8\right), 121(100)$; Found: $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 318.2065 . \mathrm{C}_{19} \mathrm{H}_{28} \mathrm{NO}_{3}$ requires $M, 318.2069$.

## (2SR,3SR)-Methyl 5-[1'-ethyl-4'-(4'-methoxy-benzyloxy)-cyclohexyl]-3-hydroxy-2-

 (4-methylphenylsulfonylamino)-pent-4-ynolate 446

To a solution of lithium diisopropylamine ( $2.04 \mathrm{~mL}, 15.0 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(15 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added a solution of methyl $N$-tosyl glycinate $154(1.46 \mathrm{~g}, 6.0 \mathrm{mmol})$ and $\operatorname{tin}(\mathrm{II})$ chloride $(2.84 \mathrm{~g}, 15.0 \mathrm{mmol})$ in anhydrous tetrahydrofuran $(15 \mathrm{~mL})$ and the ynal 445 $(1.80 \mathrm{~g}, 6.0 \mathrm{mmol})$ as described in the general procedure. After the work-up, the product was purified by column chromatography ( $20-50 \%$ ethyl acetate in petroleum ether) to give the hydroxy ester 446 (mixed with $N$-tosyl glycinate, $12 \%$ by NMR) as a pale yellow oil ( 110 mg , $3 \%$ ), anti:syn $=75: 25 ; \mathrm{R}_{\mathrm{f}} 0.10$ ( $40 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3286 (br), 2933 (m), 2855 (w), 2232 (w), 1745 (m), 1612 (w), 1514 (s), 1443 (m), 1337 (m), 1248 (s), $1164(\mathrm{~s}), 1092(\mathrm{~s}), 1035(\mathrm{w})$ and $816(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.87\left(3 \mathrm{H}, \mathrm{t}, J 7.8, \mathrm{CH}_{3}\right), 1.00-1.87(10 \mathrm{H}, \mathrm{m}, 5$
$\left.\mathrm{x} \mathrm{CH}_{2}\right), 2.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 2.67(1 \mathrm{H}, \mathrm{d}, J 10.5, \mathrm{OH}), 3.10-3.16\left(1 \mathrm{H}, \mathrm{m}, 4{ }^{\prime}-\mathrm{H}\right), 3.49(3 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), $3.72\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArOCH}_{3}\right), 4.06(1 \mathrm{H}, \mathrm{dd}, J 9.3,3.6,2-\mathrm{H}), 4.3-4.41\left(2 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{2}\right), 4.61$ $(1 \mathrm{H}, \mathrm{dd}, J 10.5,3.6,3-\mathrm{H}), 5.45(1 \mathrm{H}, \mathrm{d}, J 9.3, \mathrm{NH}), 6.79(2 \mathrm{H}, \mathrm{d}, J 8.4,2 \times \mathrm{ArH}), 7.18-7.26(4 \mathrm{H}$, $\mathrm{m}, 4 \times \mathrm{ArH})$ and $7.67(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$; $\delta_{\mathrm{C}} 6.6\left(\mathrm{CH}_{3}\right), 12.8\left(\mathrm{ArCH}_{3}\right), 26.4,26.6,29.1$, 32.4, $32.7\left(5 \mathrm{x} \mathrm{CH}_{2}\right), 34.2\left(1^{\prime}-\mathrm{C}\right), 50.4\left(\mathrm{OCH}_{3}\right), 52.8(2(3)-\mathrm{CH}), 58.1\left(\mathrm{ArOCH}_{3}\right), 60.6$ (3(2)$\mathrm{CH}), 69.9\left(\mathrm{OCH}_{2}\right), 74.3\left(4^{\prime}-\mathrm{CH}\right), 76.2,90.1(2 \times \mathrm{C} \equiv), 111.2,126.7,127.1,127.3(8 \times \mathrm{ArCH})$, $128.5,133.6,141.5,156.5(4 \times \mathrm{ArC})$ and $167.0(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 544\left([\mathrm{M}+\mathrm{H}]^{+}, 15\right), 391$ (15), 338 (50), 104 (78), 89 (100); Found: $[\mathrm{M}+\mathrm{H}]^{+}, 544.2370 . \mathrm{C}_{29} \mathrm{H}_{38} \mathrm{NO}_{7} \mathrm{~S}$ requires $M$, 544.2363.

The minor isomer was identified by resonances at $\delta_{\mathrm{H}} 4.03(1 \mathrm{H}, \mathrm{dd}, J 9.3,3.6,2-\mathrm{H}), 4.57(1 \mathrm{H}$, dd, $J 10.5,3.6,3-\mathrm{H})$ and $5.35(1 \mathrm{H}, \mathrm{d}, J 9.3, \mathrm{NH})$. The ratio was calculated by careful integration of the resonance at $\delta_{\mathrm{H}} 5.35(1 \mathrm{H}, \mathrm{d}, J 9.3, \mathrm{NH})$.

## 2-Nitrobenzaldehyde tosylhydrazone sodium salt $495{ }^{109}$

To a stirred solution of $p$-toluenesulfonyl hydrazide ( $0.93 \mathrm{~g}, 5.0 \mathrm{mmol}$ ) in methanol ( 5 mL ) was added $o$-nitrobenzaldehyde $493(0.76 \mathrm{~g}, 5.0 \mathrm{mmol})$ rapidly. A mild exothermic reaction ensued and the hydrazide dissolved. Within a few minutes, the hydrazone began to crystallize. After 15 min , the mixture was cooled in an ice bath. The product was collected on a Büchner funnel, washed with a small amount of cold methanol and dried in vacuo. After 6 h, the dry tosylhydrazone 491 was left as a colourless solid ( $1.30 \mathrm{~g}, 76 \%$ ), mp $153-154^{\circ} \mathrm{C}$ [lit. mp ${ }^{109}$ $154^{\circ} \mathrm{C}$ ]; $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3192 (m), 2921 (s), 2853 (s), 1596 (w), 1524 (m), 1462 (s), 1376 (m), 1345 (m), 1171 (m), 1087 (w), 1065 (w), 948 (w), 932 (w), 809 (w), 746 (w) and 664 (w); $\delta_{\mathrm{H}} 2.37\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 7.43(2 \mathrm{H}, \mathrm{d}, J 8.1,2 \mathrm{x} \mathrm{ArH}), 7.64(1 \mathrm{H}, \mathrm{t}, J 7.7, \mathrm{ArH}), 7.74-7.78$ $(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{x} \mathrm{ArH}), 7.82(1 \mathrm{H}, \mathrm{d}, J 7.7, \mathrm{ArH}), 8.03(1 \mathrm{H}, \mathrm{d}, J 7.7, \mathrm{ArH}), 8.28(1 \mathrm{H}, \mathrm{s}, \mathrm{CH})$ and $10.25(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}) ; \delta_{\mathrm{C}} 21.4\left(\mathrm{ArCH}_{3}\right), 125.0(\mathrm{ArCH}), 127.5(2 \mathrm{x} \mathrm{ArCH}), 128.2(\mathrm{ArCH}), 128.3$ ( ArC ), 130.2 ( 2 x ArCH ), 131.1, 134.1 ( $2 \times \mathrm{ArCH}$ ), 136.4, 142.7, $144.0(3 \times \mathrm{ArC})$ and 148.7 $(\mathrm{CH}=) ; m / z[\mathrm{APcI}], 320\left([\mathrm{M}+\mathrm{H}]^{+}, 55\right), 137(30), 114(55), 76$ (100). To a solution of the tosylhydrazone $491(0.5 \mathrm{~g}, 1.6 \mathrm{mmol})$ in methanol ( 2 mL ) was added a $25 \%$ solution of sodium methoxide in methanol $(0.34 \mathrm{~mL}, 1.6 \mathrm{mmol})$ and the mixture was stirred for 30 min .

The methanol was then evaporated and the last traces removed in vacuo for 6 h to give the tosylhydrazone sodium salt 495 as a red-brown solid, which was suitable for further use.

## 2-Bromobenzaldehyde tosylhydrazone sodium salt $496{ }^{86}$

To a stirred solution of $p$-toluenesulfonyl hydrazide ( $1.10 \mathrm{~g}, 5.91 \mathrm{mmol}$ ) in methanol ( 5 mL ) was added 2 -bromobenzaldehyde $494(1.09 \mathrm{~g}, 5.91 \mathrm{mmol})$ and using exactly the same method described in the foregoing experiment, column chromatography gave the tosylhydrazone 492 as a colourless solid ( $1.2 \mathrm{~g}, 55 \%$ ), $\mathrm{mp} 152-153^{\circ} \mathrm{C}$ [lit. $\mathrm{mp}^{86} 151-152^{\circ} \mathrm{C}$ ]; $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3169 (m), 2916 (s), 2853 (s), 1458 (s), 1378 (m), 1323 (w), 1162 (m), 1062 (w), 951 (w), 926 (w), 816 (w), $760(\mathrm{w})$ and $660(\mathrm{w}) ; \delta_{\mathrm{H}} 2.27\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 7.23(1 \mathrm{H}, \operatorname{td}, J 7.8,1.8, \mathrm{ArH})$, $7.32-7.34(3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}), 7.55(1 \mathrm{H}, \mathrm{d}, J 7.8, \mathrm{ArH}), 7.62(1 \mathrm{H}, \mathrm{dd}, J 7.8,1.8, \mathrm{ArH}), 7.67$ $(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \mathrm{x} \mathrm{ArH}), 8.11(1 \mathrm{H}, \mathrm{s}, \mathrm{CH})$ and $11.65(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}) ; \delta_{\mathrm{C}} 21.0\left(\mathrm{ArCH}_{3}\right), 123.1$ ( ArC ), $126.8(\mathrm{ArCH}), 127.1(2 \times \mathrm{ArCH}), 128.1(\mathrm{ArCH}), 129.8(2 \times \mathrm{ArCH}), 131.8(\mathrm{ArCH})$, $132.2(\mathrm{ArC}), 133.1(\mathrm{ArCH}), 135.8,143.9(2 \mathrm{x} \mathrm{ArC})$ and $144.9(\mathrm{CH}=) ; m / z[\mathrm{APcl}], 355$ $\left(\left[M\left({ }^{81} \mathrm{Br}\right)+\mathrm{H}\right]^{+}, 35\right), 353(40), 169$ (15), 113 (100), 73 (95). To a solution of the tosylhydrazone $57(1.0 \mathrm{~g}, 2.83 \mathrm{mmol}$ ) in methanol ( 3 mL ) was added a solution of $25 \%$ sodium methoxide in methanol ( $0.62 \mathrm{~mL}, 2.87 \mathrm{mmol}$ ) as described in the forgoing experiment. The work-up and evacuation gave the tosylhydrazone sodium salt 496 as a pale pink solid, which was suitable for further use.

## $N$-(2,2-Dimethyl-propylidene)-4-methyl-benzenesulfonamide $478{ }^{85}$

To a stirred solution of pivalaldehyde $(0.86 \mathrm{~g}, 10 \mathrm{mmol})$ and toluene-p-sulfonamide ( 1.70 g , 10 mmol ) in anhydrous benzene ( 70 mL ) under reflux containing $4^{\circ} \mathrm{A}$ molecular sieves ( 1.00 g ), was added a catalytic amount of $\mathrm{BF}_{3}-\mathrm{Et}_{2} \mathrm{O}$. Reflux was continued for 16 h and the mixture was then cooled, filtered and washed with 2 M aqueous sodium hydroxide ( 20 mL ). The organic layer was separated, dried and evaporated to give the crude imine 478 as a colourless
solid ( $1.21 \mathrm{~g}, 50 \%$ ), which was ready for further use; $\mathrm{mp} 57-59^{\circ} \mathrm{C}\left[\right.$ lit. $\left.\mathrm{mp}^{85} 58^{\circ} \mathrm{C}\right] ; \mathrm{R}_{\mathrm{f}} 0.76$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2970 (w), 1782 (w), 1752 (w), 1715 (w), 1630 (m), 1320 (s), 1158 (s), 1091 (m), $755(\mathrm{~m})$ and $670(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.07\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right)$, $2.34\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 7.27(2 \mathrm{H}, \mathrm{d}, J 7.6,2 \mathrm{x} \mathrm{ArH}), 7.74(2 \mathrm{H}, \mathrm{d}, J 7.6,2 \mathrm{x} \mathrm{ArH})$ and $8.38(1 \mathrm{H}$, $\mathrm{s}, \mathrm{CH}=) ; \delta_{\mathrm{C}} 22.7\left(\mathrm{ArCH}_{3}\right), 27.2\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 128.4(2 \mathrm{x} \mathrm{ArCH}), 130.2(2 \mathrm{x} \mathrm{ArCH}), 134.1,144.2$ $(2 \times \mathrm{ArC})$ and $171.0(\mathrm{CH}=) ; \mathrm{m} / \mathrm{z}$ [APcI], $340\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 155(15)$. These data are consistent with those recorded in the literature. ${ }^{85}$

## 2-(2'-Bromo-phenyl)-3-t-butyl-1-(4'-methylphenylsulfonyl)-aziridine 459

To a round-bottomed flask containing the tosylhydrazone sodium salt 496 ( 1.88 g 5.01 mmol ) were added sequentially: rhodium acetate ( $14.8 \mathrm{mg}, 0.03 \mathrm{mmol}$ ), triethylbenzylammonium chloride ( 152 mg 0.67 mmol ), a solution of imine $478(0.80 \mathrm{~g}, 3.34 \mathrm{mmol}$ ) in dioxane ( 10 mL ) and tetrahydrothiophene ( $0.3 \mathrm{~mL}, 3.34 \mathrm{mmol}$ ). The mixture was stirred vigorously at room temperature for 10 min , then at $40^{\circ} \mathrm{C}$ for 16 h . The reaction was diluted with dichloromethane $(10 \mathrm{~mL})$ and filtered through a short plug of silica. The filtrate was washed with water ( $2 \times 10 \mathrm{~mL}$ ) and dried. The concentrated crude product was purified by flash column chromatography to give the aziridine 459 as a yellow solid ( $0.75 \mathrm{~g}, 60 \%$ ), mp 88$89^{\circ} \mathrm{C}: \mathrm{R}_{\mathrm{f}} 0.57\left(10 \%\right.$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] $2954(\mathrm{~s}), 1597(\mathrm{~m})$, 1478 (m), 1439 (m), 1410 (m), 1364 (m), 1328 (s), 1292 (m), 1160 (s), 1091 (m), 1025 (m), $962(\mathrm{~m}), 889(\mathrm{~m}), 775(\mathrm{~s}), 754(\mathrm{~m})$ and $679(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.62\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.37(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 2.84(1 \mathrm{H}, \mathrm{d}, J 7.4,3-\mathrm{H}), 3.81(1 \mathrm{H}, \mathrm{d}, J 7.4,2-\mathrm{H}), 7.02-7.05(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}), 7.23$ ( $1 \mathrm{H}, \mathrm{dd}, J 7.7,1.7, \mathrm{ArH}$ ), $7.28(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH}), 7.42(1 \mathrm{H}, \mathrm{dd}, J 7.7,1.7, \mathrm{ArH})$ and 7.84 $(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 21.7\left(\mathrm{ArCH}_{3}\right), 27.99\left(3 \times \mathrm{CH}_{3}\right), 32.2(\mathrm{C}), 47.4,55.2$ (2- and 3-CH), $123.0(\mathrm{ArCBr}), 127.0(\mathrm{ArCH}), 128.3(2 \times \mathrm{ArCH}), 129.3(\mathrm{ArCH}), 129.7(2 \times \mathrm{ArCH}), 130.3$, $132.3(2 \times \mathrm{ArCH})$ and $131.6,133.8,134.7(3 \mathrm{x} \mathrm{ArC}) ; m / z[\mathrm{APcI}], 410\left(\left[\mathrm{M}\left({ }^{81} \mathrm{Br}\right)+\mathrm{H}\right]^{+}, 100\right)$, 408 (92), Found $\left[\mathrm{M}\left({ }^{79} \mathrm{Br}\right)+\mathrm{H}\right]^{+}, 408.0631 . \mathrm{C}_{19} \mathrm{H}_{23}{ }^{79} \mathrm{BrNO}_{2} \mathrm{~S}$ requires $M, 408.0627$.

The aziridine $459(2.10 \mathrm{~g}, 5.15 \mathrm{mmol})$ was dissolved in trifluoroacetic acid $(17 \mathrm{~mL})$ at room temperature and the solution stirred for 15 h . Concentration under reduced pressure gave a crude trifluoroacetate 517; $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] $2969(\mathrm{~m}), 2926(\mathrm{~m}), 1787(\mathrm{~m}), 1598(\mathrm{w}), 1470$ (m), 1440 (m), 1337 (m), 1224 (m), 1158 (s), 1091 (m), 1026 (m), 914 (w), 813 (w), 752 (m) and $657(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.92\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.31\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.72(1 \mathrm{H}, \mathrm{dd}, J 10.4,1.0,1-\mathrm{H})$, $4.73\left(1 \mathrm{H}, \mathrm{d}, J 10.4,1^{\prime}-\mathrm{H}\right)$ and $6.96-7.85(8 \mathrm{H}, \mathrm{m}, 8 \times \mathrm{ArH}) ; m / z[\mathrm{APcI}] 525\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 524$ (50), 522 (100), 407 (55), 409 (60), 354 (50), 352 (20). The trifluoroacetate was dissolved in methanol ( 20 mL ) and saturated aqueous potassium carbonate $(20 \mathrm{~mL})$ was added. The mixture was stirred for 2 h at room temperature and then concentrated. The residue was extracted with dichloromethane ( $2 \times 20 \mathrm{~mL}$ ) and the extracts dried, diluted with ether ( 5 mL ), filtered through a short plug of silica gel and evaporated to give the alcohol $\mathbf{4 5 8}$ as a brownish oil ( $1.75 \mathrm{~g}, 80 \%$ ): $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3504 (br), 2946 (m), 2906 (s), 1761 (w), 1598 (w), 1469 (m), 1415 (m), 1327 (m), 1223 (s), 1155 (s), 1093 (m), 1068 (m), 1028 (m), 910 (w), 813 (w), $752(\mathrm{~m})$ and $657(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.95\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.29\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.46(1 \mathrm{H}, \mathrm{d}, J 9.6,1.1,1-$ H), $5.04\left(1 \mathrm{H}, \mathrm{d}, J 9.6,1^{\prime}-\mathrm{H}\right), 5.33(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 7.00-7.09(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH})$ and 7.29-7.41 $(6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 21.4\left(\mathrm{ArCH}_{3}\right), 28.0\left(3 \mathrm{x} \mathrm{-} \mathrm{CH}_{3}\right), 36.5(\mathrm{C}), 64.9,71.2(1-$ and $2-\mathrm{CH})$, 121.3 ( ArCBr ), 126.4, 127.2 ( 2 x ArCH ), 127.6, 127.9 ( $4 \times \mathrm{ArCH}$ ), $132.4,129.3$ ( $2 \times \mathrm{ArCH}$ ) and $139.4,141.2,142.2(3 \times \mathrm{ArC}) ; m / z[\mathrm{APcI}] 409\left(\left[\mathrm{M}\left({ }^{81} \mathrm{Br}\right)-\mathrm{H}_{2} \mathrm{O}\right]^{+}, 100\right), 407\left({ }^{79} \mathrm{Br}, 98\right)$, 352 (50), Found $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 443.1004 . \mathrm{C}_{19} \mathrm{H}_{28}{ }^{79} \mathrm{BrN}_{2} \mathrm{O}_{3} \mathrm{~S}$ requires $M, 443.0999$.

## 1-(2'-Bromobenzoyl)-3,3-dimethyl-2-(4-Methyl-phenylsulfonamino)-butan-1-one 457

To a mixture of $4^{\circ} \mathrm{A}$ molecular sieves ( 1.5 g ) and pyridinium chlorochromate ( $1.03 \mathrm{~g}, 4.77$ mmol ) in anhydrous dichloromethane ( 15 mL ) was added $N$-(2-hydroxy-1,2-diphenyl-ethyl)-4-methylphenylsulfonamide $458(1.35 \mathrm{~g}, 3.18 \mathrm{mmol})$ in dichrolomethane ( 15 mL ) as
described in general precedure for PCC oxidation. Work-up gave the ketone 457 as a light
 1697 (m), 1598 (w), 1466 (m), 1429 (m), 1336 (s), 1222 (m), 1164 (s), 1090 (m), 1029 (m), $980(\mathrm{w}), 932(\mathrm{w}), 814(\mathrm{~m}), 768(\mathrm{~m}), 728(\mathrm{~m})$ and $667(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.81\left(9 \mathrm{H}, \mathrm{s}, 3 \mathrm{xCH}_{3}\right), 2.24(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{ArCH}_{3}\right), 4.33(1 \mathrm{H}, \mathrm{d}, J 10.0,2-\mathrm{H}), 5.72(1 \mathrm{H}, \mathrm{d}, J 10.0, \mathrm{NH}), 6.92(1 \mathrm{H}, \mathrm{dd}, J 7.3,1.7, \mathrm{ArH})$, 7.13-7.25 ( $4 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{ArH}$ ), 7.53 ( $1 \mathrm{H}, \mathrm{dd}, J 7.3,1.7, \mathrm{ArH}$ ) and $7.67(2 \mathrm{H}, \mathrm{d}, J 8.3,2 \times \mathrm{ArH}$ ); $\delta_{\mathrm{C}} 21.5\left(\mathrm{ArCH}_{3}\right), 27.0\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 36.5(\mathrm{C}), 70.0(2-\mathrm{CH}), 120.2(\mathrm{ArCBr}), 126.9,129.2(4 \mathrm{x}$ $\mathrm{ArCH}), 132.7,134.9(2 \times \mathrm{ArCH}), 127.5,129.7(2 \times \mathrm{ArCH}), 136.7,139.3,143.8(3 \times \mathrm{ArC})$ and $201.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 425\left(\left[\mathrm{M}\left({ }^{81} \mathrm{Br}\right)+\mathrm{H}\right]^{+}, 52\right), 424\left({ }^{79} \mathrm{Br}, 50\right), 426$ (12), 88 (40), 72 (100), Found $[\mathrm{M}+\mathrm{H}]^{+}, 424.0576 . \mathrm{C}_{19} \mathrm{H}_{23}{ }^{79} \mathrm{BrNO}_{3} \mathrm{~S}$ requires $M, 424.0577$.

## 1-(2'-Bromobenzoyl)-3,3-dimethyl-2-(4-methylphenylesulfonamino)-1-methylsulphinylmethyl-butan-1-ol 522

To a solution of lithium acetylide-ethylenediamine 254 ( $73 \mathrm{mg}, 0.71 \mathrm{mmol}$ ) in anhydrous dimethylsulfoxide ( 1 mL ) at room temperature were added a solution of ketone 457 ( 50 mg , 0.12 mmol ) in anhydrous dimethylsulfoxide ( 1 mL ) as described in general precedure method 1. After the work-up and the combined ether solutions were then dried and evaporated to give a white solid. After flash chromatography ( $25 \%$ ethyl acetate in petroleum ether), the alcohol $522(0.1 \mathrm{~g}, 85 \%)$ was isolated, $\mathrm{mp} 234-235^{\circ} \mathrm{C}: \mathrm{R}_{\mathrm{f}} 0.12$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3318 (br), 3267 (br), 2935 (w), 1594 (w), 1426 (m), 1329 (m), 1212 (w), $1156(\mathrm{~s}), 1073(\mathrm{~m}), 1018(\mathrm{~s}), 908(\mathrm{~m}), 816(\mathrm{w}), 760(\mathrm{w}), 734(\mathrm{~m})$ and $660(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.52(9 \mathrm{H}, \mathrm{s}$, $\left.3 \times \mathrm{CH}_{3}\right), 2.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.37\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.21\left(1 \mathrm{H}, \mathrm{d}, J 13.4, \mathrm{SCH}_{\mathrm{a}}\right), 4.09(1 \mathrm{H}, \mathrm{d}, J$ $13.4, \mathrm{SCH}_{\mathrm{b}}$ ), 4.53 ( $1 \mathrm{H}, \mathrm{dd}, J 9.8,1.8,2-\mathrm{CH}$ ), $5.31(1 \mathrm{H}, \mathrm{d}, J 9.8, \mathrm{NH}), 5.47$ ( $1 \mathrm{H}, \mathrm{d}, J 1.8, \mathrm{OH}$ ), $7.14(1 \mathrm{H}, \mathrm{td}, J 7.8,1.5, \mathrm{ArH}), 7.25(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH}), 7.36(1 \mathrm{H}, \mathrm{td}, J 7.8,1.5, \mathrm{ArH}), 7.51$ $(1 \mathrm{H}, \mathrm{dd}, J 7.8,1.5, \mathrm{ArH}), 7.75(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH})$ and $7.97(1 \mathrm{H}, \mathrm{td}, J 7.8,1.5, \mathrm{ArH}) ; \delta_{\mathrm{C}}$ $21.5\left(\mathrm{ArCH}_{3}\right), 28.8\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 37.8(\mathrm{C}), 39.0\left(\mathrm{SCH}_{3}\right), 60.2\left(\mathrm{SCH}_{2}\right), 65.1(2-\mathrm{CH}), 81.8(1-\mathrm{C})$, 120.9 ( ArCBr ), 126.9 ( 2 x ArCH ), 128.1 ( ArCH ), 129.6 ( 2 x ArCH ), 130.0, 130.6, 134.9 ( 3 x $\mathrm{ArCH})$ and $139.5,141.6,143.1(3 \mathrm{x} \mathrm{ArC}) ; m / z[\mathrm{APcl}] 505\left(\left[\mathrm{M}\left({ }^{81} \mathrm{Br}\right)+\mathrm{H}\right]^{+}, 100\right), 502\left({ }^{79} \mathrm{Br}\right.$, 98), Found $[\mathrm{M}+\mathrm{H}]^{+}$, 502.0719. $\mathrm{C}_{21} \mathrm{H}_{29}{ }^{79} \mathrm{BrNO}_{4} \mathrm{~S}_{2}$ requires $M, 502.0716$.

## 3-(2'-Bromobenzoyl)-5,5-dimethyl-4-(4-methylphenylesulfonamino)-hex-1-yn-3-ol 456

To a stirred solution of 0.5 M ethynylmagnesium bromide ( 12.74 mL in THF, 6.4 mmol ) in anhydrous tetrahydrofuran ( 5 mL ) was adding the ketone $457(0.9 \mathrm{~g}, 2.12 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $(5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was allowed to stir at room temperature for 16 h and then poured into saturated aqueous ammonium chloride ( 25 mL ). The organic layer was separated, dried and evaporated to give the crude product as a yellow oil. Column chromatography ( $25 \%$ ethyl acetate in petroleum ether) gave the ynol 456 as a colourless solid ( $0.5 \mathrm{~g}, 52 \%$ ), mp 175-176 ${ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.30$ ( $25 \%$ ethyl acetate in petroleum ether); $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 3486 (br), 2955 (s), 2212 (w), 1594 (w), 1463 (m), 1432 (m), 1328 (m), $1155(\mathrm{~s}), 1083(\mathrm{~m}), 1028(\mathrm{~m}), 901(\mathrm{w}), 813(\mathrm{w}), 755(\mathrm{w}), 690(\mathrm{w})$ and $661(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.74(9 \mathrm{H}, \mathrm{s}$, $\left.3 \mathrm{x} \mathrm{CH}_{3}\right), 2.31\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 3.09(1 \mathrm{H}, \mathrm{s}, 1-\mathrm{CH}), 4.64(1 \mathrm{H}, \mathrm{d}, J 9.8,4-\mathrm{CH}), 5.18(1 \mathrm{H}, \mathrm{d}, J$ $9.8, \mathrm{NH}), 7.06(1 \mathrm{H}, \mathrm{td}, J 7.8,1.6, \mathrm{ArH}), 7.10-7.15(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{x} \mathrm{ArH}), 7.51(1 \mathrm{H}, \mathrm{dd}, J 7.8,1.6$, $\mathrm{ArH}), 7.58(2 \mathrm{H}, \mathrm{d}, J 8.0,2 \times \mathrm{ArH})$ and $7.76(1 \mathrm{H}, \mathrm{td}, J 7.8,1.6, \mathrm{ArH}) ; \delta_{\mathrm{C}} 21.5\left(\mathrm{ArCH}_{3}\right), 28.9(3$ x $\mathrm{CH}_{3}$ ), $37.6(5-\mathrm{C}), 65.0(4-\mathrm{CH}), 76.5,77.8(\mathrm{C} \equiv$ and $3-\mathrm{C}), 84.6(\mathrm{CH} \equiv), 121.5(\mathrm{ArCBr}), 126.9$ $(2 \times \mathrm{ArCH}), 127.4(\mathrm{ArCH}), 128.9(2 \mathrm{x} \mathrm{ArCH}), 129.2,129.7,135.0(3 \times \mathrm{ArCH})$ and 139.9, $140.5,142.3$ ( $3 \times \mathrm{ArC}$ ); $m / z[\mathrm{APcI}] 434\left(\left[\mathrm{M}\left({ }^{81} \mathrm{Br}\right)-\mathrm{OH}\right]^{+}, 30\right), 432\left({ }^{79} \mathrm{Br}, 28\right), 378$ (100), 376 (85), Found $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 467.1004 . \mathrm{C}_{21} \mathrm{H}_{28}{ }^{79} \mathrm{BrN}_{2} \mathrm{O}_{4} \mathrm{~S}$ requires $M, 467.0999$.

## 3-(2'-Bromophenyl)-2-tert-butyl-1-(4'-methylphenylsulfonyl)-pyrrole 523

To a stirred solution of acetylene $456(0.20 \mathrm{~g}, 0.44 \mathrm{mmol})$ in dichloromethane ( 5 mL ) was added $10 \% \mathrm{w} / \mathrm{w}$ silver nitrate on silica gel ( $0.75 \mathrm{~g}, 0.44 \mathrm{mmol}$ ) as described in the general procedure for silver-mediated cyclization. Work-up gave the pyrrole 523 as a yellow oil (125 $\mathrm{mg}, 65 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 2925 (s), 1594 (w), 1499 (w), 1453 (w), 1368 (m), 1354 (m),
$1258(\mathrm{w}), 1172(\mathrm{~m}), 1082(\mathrm{~m}), 1021(\mathrm{~m}), 811(\mathrm{w})$ and $676(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.13\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 2.34$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 5.95(1 \mathrm{H}, \mathrm{d}, J 3.5,4-\mathrm{H}), 7.06-7.10(1 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.16-7.21(4 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH})$, $7.37(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH}), 7.40(1 \mathrm{H}, \mathrm{d}, J 3.5,5-\mathrm{H})$ and $7.49(1 \mathrm{H}, \mathrm{d}, J 8.2, \mathrm{ArH}) ; \delta_{\mathrm{C}} 21.6$ $\left(\mathrm{ArCH}_{3}\right), 31.8\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 36.1(\mathrm{C}), 114.7(\mathrm{CH}), 124.9(\mathrm{ArCBr}), 125.7(2 \times \mathrm{ArCH}), 126.7$, $126.7(2 \mathrm{CH}), 128.2(\mathrm{C}), 128.7(\mathrm{CH}), 129.7(2 \mathrm{x} \mathrm{ArCH}), 131.8,132.2(2 \mathrm{xCH})$ and 138.9, 140.2, 140.9, $144.2(4 \times \mathrm{C}) ; \mathrm{m} / \mathrm{z}[\mathrm{APcI}] 434\left(\left[\mathrm{M}\left({ }^{81} \mathrm{Br}\right)+\mathrm{H}\right]^{+}, 100\right), 432\left({ }^{79} \mathrm{Br}, 98\right), 322(30)$, 320 (38), Found $[\mathrm{M}+\mathrm{H}]^{+}, 432.0629 . \mathrm{C}_{21} \mathrm{H}_{26}{ }^{79} \mathrm{BrNO}_{2} \mathrm{~S}$ requires $\mathrm{M}, 432.0627$.

## 2-(3',3'-Dimethyl-but-1'-enyl)-benzo[1,3,2]dioxaborole 485 ${ }^{110}$

A mixture of 3,3-dimethylbut-1-yne $227(2.05 \mathrm{~g}, 25 \mathrm{mmol})$ and catecholborane $484(3.00 \mathrm{~g}$, 25 mmol ) was stirred at $70-100^{\circ} \mathrm{C}$ under nitrogen for 2 h . Distillation yielded the dioxaborole 485 as a colorless liquid $(2.68 \mathrm{~g}, 61 \%)$ at $70^{\circ} \mathrm{C}(1.8 \mathrm{mbar}){ }^{110} \nu_{\text {max }} / \mathrm{cm}^{-1}$ [film] $2960(\mathrm{~s}), 2868$ (m), 1633 ( s ), 1474 ( s$), 1398$ ( s$), 1370$ ( s$), 1329$ ( s$), 1266$ ( s$), 1236$ ( s$), 1127$ (m), 998 (m), $915(\mathrm{~m}), 875(\mathrm{w}), 809(\mathrm{~m})$ and $740(\mathrm{w}) ; \delta_{\mathrm{H}} 1.03\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 5.68(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 20.0, \mathrm{CH}=)$, $7.09(1 \mathrm{H}, \mathrm{d}, J 20.0, \mathrm{CH}=), 6.97-7.00(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}), 7.11-7.16(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 29.0$ ( $3 \mathrm{x} \mathrm{CH}_{3}$ ), $35.9(\mathrm{C}), 112.6(2 \times \mathrm{ArC}), 122.8,122.9(4 \mathrm{x} \mathrm{ArCH})$ and $148.7,168.0(2 \times \mathrm{CH}=)$; $m / z[\mathrm{APcI}] 202\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 89(100)$. These data are consistent with those recorded in the literature. ${ }^{110}$

## (E)-1-(3',3'-Dimethyl-but-1'-en-1-yl)-2-nitrobenzene 480

A round bottom flask was charged with $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(0.17 \mathrm{~g}, 0.15 \mathrm{mmol})$, powdered sodium hydroxide $(0.60 \mathrm{~g}, 15 \mathrm{mmol})$ and tetrahydrofuran $(15 \mathrm{~mL})$. To this mixture was added 2iodonitrobenzene $483(1.25 \mathrm{~g}, 5 \mathrm{mmol})$ and the borole $485(1.04 \mathrm{~g}, 5.9 \mathrm{mmol})$ at room temperature and the mixture heated to reflux for 4 h . The mixture was then cooled to room
temperature and $3 \mathrm{~N} \mathrm{NaOH}(5 \mathrm{~mL})$ and $30 \%$ hydrogen peroxide ( 1 mL ) were added to decomposed unreacted borole. The resulting mixture was extracted with hexane ( 200 mL ) and the extract washed with brine $(150 \mathrm{~mL})$ and dried. After evaporation, the crude product was purified by column chromatography ( $10 \%$ ethyl acetate in petroleum ether) to give the nitrobenzene 480 as a pale brown oil $(0.70 \mathrm{~g}, 68 \%)$ : $\mathrm{R}_{\mathrm{f}} 0.61(10 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 3532 (br), 2958 (s), 2855 (m), 1735 (m), 1634 (m), 1606 (m), 1524 (s), 1468 (m), 1347 (s), 1261 (m), 969 (w), 783 (w) and $737(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.07\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right)$, $6.15(1 \mathrm{H}, \mathrm{d}, J 16.0, \mathrm{CH}=), 6.71(1 \mathrm{H}, \mathrm{d}, J 16.0, \mathrm{CH}=), 7.27(1 \mathrm{H}, \mathrm{td}, J 7.4,1.5, \mathrm{ArH}), 7.46(2 \mathrm{H}$, td, $J 7.4,1.5, \mathrm{ArH}), 7.51(1 \mathrm{H}, \mathrm{dd}, J 7.4,1.5, \mathrm{ArH})$ and $7.98(1 \mathrm{H}, \mathrm{dd}, J 7.4,1.5, \mathrm{ArH}) ; \delta_{\mathrm{C}} 29.7$ $\left(3 \times \mathrm{CH}_{3}\right), 31.7(\mathrm{C}), 121.8(\mathrm{CH}=), 124.8,127.7,128.9$ ( 3 x ArCH ), 130.4 ( ArC ), 133.2 ( ArCH ), $139.6(\mathrm{CH}=)$ and $147.6(\mathrm{ArC}) ; m / z[\mathrm{APcI}] 206\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 146$ (18); Found: $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$, 223.1447. $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{O}_{2}$ requires $M, 223.1447$.

## (2-Bromo-benzyl)-triphenyl-phosphonium bromide salt $487^{111}$

A stirred solution of 2-bromobenzyl bromide $486(1.00 \mathrm{~g}, 4 \mathrm{mmol})$ and triphenylphosphine $(1.36 \mathrm{~g}, 5.2 \mathrm{mmol})$ in anhydrous chloroform ( 15 mL ) was refluxed for 2 h . The mixture was then poured into anhydrous ether ( 80 mL ) and the precipitate was filtered and dried to give the salt 487, as a colourless solid ( $2.00 \mathrm{~g}, 98 \%$ ), mp $138-140^{\circ} \mathrm{C}$ [lit. $\mathrm{mp}^{111} 137-138^{\circ} \mathrm{C}$ ]; $\delta_{\mathrm{H}}$ (DMSO) $5.17\left(2 \mathrm{H}, \mathrm{d}, J 14.8, \mathrm{CH}_{2}\right), 7.14-7.20(1 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.28-7.36(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH})$, 7.55-7.68 ( $7 \mathrm{H}, \mathrm{m}, 7 \times \mathrm{ArH}$ ), 7.71-7.79 ( $6 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArH}$ ) and 7.92-7.97 ( $3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}$ ). These data are consistent with those recorded in the literature. ${ }^{111}$
(2'-Bromo-benzyl)-dimethylsulfonium bromide 489 ${ }^{\text {112a }}$

To a stirred solution of 2-bromobenzyl bromide $486(2.00 \mathrm{~g}, 8 \mathrm{mmol})$ in chloroform ( 15 mL ) was added dimethyl sulfide ( $0.92 \mathrm{~mL}, 12.8 \mathrm{mmol}$ ) dropwise. After stirring for 24 h at $50^{\circ} \mathrm{C}$, the sulfonium salt 489 was filtered and rinsed with chloroform ( $2 \times 5 \mathrm{~mL}$ ). A white solid was
obtained ( $2.00 \mathrm{~g}, 80 \%$ ), mp $126-127^{\circ} \mathrm{C}$ [lit. $\left.\mathrm{mp}^{112 \mathrm{a}} 126^{\circ} \mathrm{C}\right] ; v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 2922 (s), 2855 (s), 1568 (m), 1467 (s), 1442 (s), 1377 (m), 1330 (m), 1276 (m), 1224 (m), 1204 (m), 1047 (m), $1021(\mathrm{~s}), 1007(\mathrm{~m}), 755(\mathrm{~s}), 722(\mathrm{~m})$ and $658(\mathrm{~m}) ; \delta_{\mathrm{H}}\left(\mathrm{D}_{2} \mathrm{O}\right) 2.76\left(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{CH}_{3}\right), 4.65$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 7.28(1 \mathrm{H}, \mathrm{td}, J 7.7,1.5, \mathrm{ArH}), 7.34(1 \mathrm{H}, \mathrm{td}, J 7.7,1.5, \mathrm{ArH}), 7.40(1 \mathrm{H}, \mathrm{dd}, J 7.7$, $1.5, \mathrm{ArH})$ and $7.65(1 \mathrm{H}, \mathrm{dd}, J 7.7,1.5, \mathrm{ArH})$. These data are consistent with those recorded in the literature. ${ }^{112 \mathrm{a}}$

## Dimethyl-(2'-nitrobenzyl)-sulfonium bromide $488{ }^{\text {112b }}$

Starting from 2-nitrobenzyl bromide $490(1.90 \mathrm{~g}, 8.8 \mathrm{mmol})$ and using exactly the same method described in the foregoing experiment, the work-up to dryness gave the sulfonium salt 488 as a pale purple solid ( $2.00 \mathrm{~g}, 82 \%$ ), mp $128-129^{\circ} \mathrm{C}$ [lit. $\mathrm{mp}^{112 \mathrm{~b}} 127-128^{\circ} \mathrm{C}$ ]; $v_{\max } / \mathrm{cm}^{-1}$ [nujol] 3448 (s), 3392 (s), 2925 (s), 2855 (s), 1610 (w), 1577 (w), 1526 (s), 1463 (s), 1377 (m), 1346 (s), 1308 (m), 1264 (w), 1172 (w), 1047 (w), 1008 (w), 860 (w), 793 (w), 793 (w) and $710(\mathrm{w}) ; \delta_{\mathrm{H}}\left(\mathrm{D}_{2} \mathrm{O}\right) 2.88(6 \mathrm{H}, \mathrm{s}, 2 \mathrm{x} \mathrm{CH} 3), 4.74\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 7.32(1 \mathrm{H}, \mathrm{dd}, J 7.8,1.2$, $\mathrm{ArH}), 7.33(1 \mathrm{H}, \operatorname{td}, J 7.8,1.2, \mathrm{ArH}), 7.50(1 \mathrm{H}, \operatorname{td}, J 7.8,1.2, \mathrm{ArH})$ and $8.66(1 \mathrm{H}, \mathrm{dd}, J 7.8$, $1.2, \mathrm{ArH})$. These data are consistent with those recorded in the literature. ${ }^{112 \mathrm{~b}}$

## (Z)-1-Bromo-2-(3',3'-dimethyl-but-1'-enyl)-benzene 481

To a suspension of the phosphonium salt $487(1.00 \mathrm{~g}, 1.95 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 10 mL ) was added 2.5 M n-butyl lithium ( 0.58 mL in hexanes, 1.45 mmol ) at $-30^{\circ} \mathrm{C}$ dropwise. After 10 min , pivalaldehyde ( $0.17 \mathrm{~mL}, 1.61 \mathrm{mmol}$ ) was added in one portion. The mixture was slowly warmed to room temperature and stirred for 16 h . The mixture was then evaporated to give a slurry, which was suspended in pentene ( 10 mL ) and filtered through a short plug of celite. The flitrate was evaporated and the residue dissolved in a minimum of ether. The mixture was then filtered through a short plug of silica gel to
give a solution, when evaporated, gave the styrene $481(0.28 \mathrm{~g}, 60 \%)$ as a light yellow oil; $\mathrm{R}_{\mathrm{f}}$ $0.63\left(10 \%\right.$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] $2958(\mathrm{~s}), 2855(\mathrm{~m}), 1634(\mathrm{~m})$, $1606(\mathrm{~m}), 1524$ (s), 1468 (m), 1347 (s), 1261 (m), 969 (w), $783(\mathrm{w})$ and $737(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.88$ $\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right), 5.58(1 \mathrm{H}, \mathrm{d}, J 12.5, \mathrm{CH}=), 6.13(1 \mathrm{H}, \mathrm{d}, J 12.5, \mathrm{CH}=), 6.99-7.02(1 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}), 7.15(1 \mathrm{H}, \mathrm{t}, J 8.0, \mathrm{ArH}), 7.23-7.26(1 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and $7.46(1 \mathrm{H}, \mathrm{d}, J 8.0, \mathrm{ArH}) ; \delta_{\mathrm{C}} 30.7$ $\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 34.5(\mathrm{C}), 123.5(\mathrm{ArCBr}), 125.9,126.4,128.1,131.3,132.0($ all CH$), 140.0(\mathrm{ArC})$ and $143.0(\mathrm{CH}) ; m / z[\mathrm{APcI}] 239\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$. This styrene 481 was unstable as indicated by changing of the light yellow color to dark orange over few days at room temperature. Keeping at low temperature is required!

## (S)-(+)- $\gamma$-Ethoxycarbonyl- $\gamma$-butyrolactone 549 ${ }^{95 a}$

To a suspension of L-glutamic acid $545(90.00 \mathrm{~g}, 0.612 \mathrm{~mol})$ in water ( 240 mL ) and concentrated hydrochloric acid ( 126 mL ) was added a solution of sodium nitrite ( 63.00 g , 0.912 mol ) in water ( 135 mL ) during 4 h under vigorous stirring at $-5-0^{\circ} \mathrm{C}$; the resulting clear solution was allowed to stand at room temperature for 16 h . The solvent was evaporated in vacuo below $50^{\circ} \mathrm{C}$ to give a residue, which was shaken with ethyl acetate ( 300 mL ). The insoluble material was filtered off and washed with ethyl acetate. The filtrate and washings were combined and dried. Evaporation of the solvent afforded the ( $S$ ) $-\gamma$-carboxy- $\gamma$ butyrolactone 548 as a pale yellow syrup ( $72.30 \mathrm{~g}, 91 \%$ ). A solution of the ( S ) $-\gamma$-carboxy- $\gamma$ butyrolactone $548(72.30 \mathrm{~g}, 0.556 \mathrm{~mol})$ and $p$-toluenesulfonic acid monohydrate ( 2.50 g , $0.013 \mathrm{~mol})$ in ethanol ( 130 mL ) and benzene ( 300 mL ) was refluxed for 5 h and the solvent then was distilled off under atmospheric pressure until the head temperature was raised to $79^{\circ} \mathrm{C}$. The residue was cooled to room temperature and toluene ( 1 L ) was added. The resulting solution was washed with water ( 2 x 500 mL ), $10 \%$ aqueous sodium carbonate ( 2 x 500 mL ) and dried. Evaporation of the solvent and distillation of the residue gave the ethoxycarbonyl- $\gamma$-butyrolactone 549 as a light yellow liquid ( $69.00 \mathrm{~g}, 79 \%$ ) of bp 123-128\%/8 mm [Lit. ${ }^{95 \mathrm{a}}$ bp $\left.135-140^{\circ} / 10 \mathrm{~mm}\right] ; v_{\max } / \mathrm{cm}^{-1}$ [film] 2984 (m), 1789 (s), 1746 (s), 1378 (m), $1276(\mathrm{~s}), 1216(\mathrm{~s}), 1146(\mathrm{~s}), 1069(\mathrm{~s}), 1027(\mathrm{~s})$ and $854(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.25\left(3 \mathrm{H}, \mathrm{t}, J 7.1, \mathrm{CH}_{3}\right), 2.28-$ $2.54(4 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{CH} 2), 4.21\left(2 \mathrm{H}, \mathrm{q}, J 7.1, \mathrm{OCH}_{2}\right)$ and $4.65-4.87(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}) ; \delta_{\mathrm{C}} 14.1\left(\mathrm{CH}_{3}\right)$,
25.9, 26.8, $62.1\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 75.8(\mathrm{CH})$ and $169.9,176.1(2 \times \mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 159\left([\mathrm{M}+\mathrm{H}]^{+}\right.$, 100), 79 (15), 71 (20 These data are consistent with those recorded in the literature. ${ }^{95 a}$

## (S)-(+)- $\gamma$-Hydroxymethyl- $\gamma$-butyrolactone $544^{95 a}$

To a suspension of sodium borohydride ( $8.40 \mathrm{~g}, 0.221 \mathrm{~mol}$ ) in ethanol ( 180 mL ) was added a solution of ethoxycarbonyl- $\gamma$-butyrolactone $549(35.00 \mathrm{~g}, 0.221 \mathrm{~mol})$ in ethanol $(300 \mathrm{~mL})$ at $20-25^{\circ} \mathrm{C}$ and the resulting mixture stirred at room temperature for 1 h . The mixture was adjusted to pH 3 with $10 \%$ aqueous HCl , the resulting white solid was filtered off and the filtrate was evaporated. The process of methanol addition and evaporation was repeated 4 times and then the residue was purified by column chromatography on silica gel ( 250 g ) with 7\% ethanol-chloroform as eluting solvent to give a yellow oil. Distillation of this oil gave hydroxymethyl- $\gamma$-butyrolactone 544 as a light yellow liquid ( $22.82 \mathrm{~g}, 89 \%$ ) of bp 120$122^{\circ} \mathrm{C} / 5 \mathrm{~mm}$ [Lit. ${ }^{95 \mathrm{a}}$ bp 131-147$/ 7 \mathrm{~mm}$ ]; $v_{\max } / \mathrm{cm}^{-1}$ [film] 3384 (b), 2930 (m), 2875 (w), 1767 (s), $1357(\mathrm{~m}), 1192(\mathrm{~s}), 1062(\mathrm{~s})$ and $854(\mathrm{~m}) ; \delta_{\mathrm{H}} 2.17-2.29\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.54-2.71(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right)$, 3.64-3.75 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$ and 4.65-4.67 $(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}) ; \delta_{\mathrm{C}} 23.2,28.7,64.1\left(3 \mathrm{x} \mathrm{CH}_{2}\right), 80.8$ $(\mathrm{CH})$ and $177.8(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 117\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right), 99(65), 71(20)$. These data are consistent with those recorded in the literature. ${ }^{95 \mathrm{a}}$

## (S)-(+)- $\gamma$-trityloxymethyl- $\gamma$-butyrolactone $550{ }^{95 a}$

To a stirred solution of hydroxymethyl- $\gamma$-butyrolactone $544(4.0 \mathrm{~g}, 34.48 \mathrm{mmol})$ in pyridine ( 35 mL ) was added triphenylmethyl chloride $(9.61 \mathrm{~g}, 34.48 \mathrm{mmol}$ ) at room temperature and stirring was continued for 20 h . Most of the pyridine was then distilled off at $50-60^{\circ} \mathrm{C}$ under vacuum. The residue was dissolved in dichloromethane ( 70 mL ) and the resulting solution washed thoroughly with brine ( 5 x 20 mL ) then dried and evaporated. The residue was purified by column chromatography with $25 \%$ ethyl acetate in petroleum ether as eluting solvent to give a colorless crystalline solid which was recrystallised twice from boiling
methanol to give $\gamma$-trityloxymethyl- $\gamma$-butyrolactone 550 as white needles $(7.50 \mathrm{~g}, 60 \%)$, mp $148-149^{\circ} \mathrm{C}\left[\right.$ Lit. $\left.{ }^{95 \mathrm{a}} \mathrm{mp} 148-149^{\circ} \mathrm{C}\right] ;[\alpha]_{\mathrm{D}}+26.7^{\circ}$ (c $1, \mathrm{CHCl}_{3}$ ) $\left[\right.$ lit. ${ }^{17 \mathrm{~b}}[\alpha]_{\mathrm{D}}+28.6^{\circ}$ (c 1 , $\mathrm{CHCl}_{3}$ )]; $v_{\text {max }} / \mathrm{cm}^{-1}$ [nujol] 2931 (m), 2860 (m), 1767 (s), 1474 (w), 1426 (w), 1362 (w), 1180 (m), $1110(\mathrm{~s}), 997(\mathrm{~m}), 944(\mathrm{~m}), 826(\mathrm{~m})$ and $700(\mathrm{~m}) ; \delta_{\mathrm{H}} 1.90-2.03\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{a}}\right), 2.12-2.23$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{~b}}$ ), $2.45\left(1 \mathrm{H}\right.$, ddd, $J 17.2,10.9,6.6, \mathrm{CH}_{2 \mathrm{a}}$ ), $2.61\left(1 \mathrm{H}, \mathrm{ddd}, J 17.2,10.9,6.6, \mathrm{CH}_{2 \mathrm{~b}}\right.$ ), $3.08\left(1 \mathrm{H}, \mathrm{dd}, J 10.4,4.3, \mathrm{OCH}_{2 \mathrm{a}}\right), 3.35\left(1 \mathrm{H}, \mathrm{dd}, J 10.4,4.3, \mathrm{OCH}_{2 \mathrm{~b}}\right), 4.57-4.61(1 \mathrm{H}, \mathrm{m}, \mathrm{CH})$, 7.16-7.20 (3H, m, $3 \times \mathrm{ArH}$ ), 7.23-7.26 ( $6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}$ ) and 7.36-7.38 ( $6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}$ ); $\delta_{\mathrm{C}}$ 24.2, 28.5, $65.2\left(3 \mathrm{x} \mathrm{CH}_{2}\right.$ ), 79.1 (CH), 96.7 (C), 127.2 ( 3 x ArCH ), 128.0 ( 6 x ArCH ), 128.6 ( $6 \times \mathrm{ArCH}$ ), $143.5(3 \times \mathrm{ArC})$ and $172.3(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 359\left([\mathrm{M}+\mathrm{H}]^{+}, 100\right)$. These data are consistent with those recorded in the literature. ${ }^{95 \mathrm{a}}$

## (+)-(3R,5S)-3-Allyl-5-trityloxymethyl- - -butyrolactone $\mathbf{5 5 2}^{95 b}$

550

552

Diisopropylamine ( $2.4 \mathrm{~mL}, 17.44 \mathrm{mmol}$ ) was dissolved in anhydrous tetrahydrofuran ( 5 mL ) at $0^{\circ} \mathrm{C}$ under nitrogen. A solution of $2.5 \mathrm{M} n$-butyl lithium ( 6.98 mL in hexane, 17.44 mmol ) was added dropwise and the solution stirred at $0^{\circ} \mathrm{C}$ for 30 min . The lithium diisopropylamide thus formed was cooled to $-78^{\circ} \mathrm{C}$. A solution of the lactone $550(4.60 \mathrm{~g}, 12.8 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 50 mL ) was added dropwise during 25 min and the resulting mixture stirred at $-78^{\circ} \mathrm{C}$ for 1 h . Allyl bromide ( $1.45 \mathrm{~mL}, 16.74 \mathrm{mmol}$ ) was added and the reaction stirred at $-78^{\circ} \mathrm{C}$ for 1.5 h , then quenched by aqueous sodium sulphate solution ( 25 $\mathrm{mL})$ and diluted with diethyl ether $(25 \mathrm{~mL})$. The layers were then separated and the organic layer was washed twice with brine and dried. Removal of the solvent gave the 3-allyl- $\gamma$ butyrolactone 552 as a light yellow oil ( $4.90 \mathrm{~g}, 96 \%$ ); $[\alpha]_{\mathrm{D}}+15.7^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ) [Lit. ${ }^{95 \mathrm{~b}}[\alpha]_{\mathrm{D}}$ $\left.+24.8^{\circ}\left(\mathrm{c}^{2} 1.96, \mathrm{CHCl}_{3}\right)\right] ; v_{\max } / \mathrm{cm}^{-1}[\mathrm{film}] 2925(\mathrm{w}), 2865(\mathrm{w}), 1755(\mathrm{~s}), 1644(\mathrm{~m}), 1490(\mathrm{~m})$, $1448(\mathrm{~m}), 1265(\mathrm{w}), 1220(\mathrm{w}), 1154(\mathrm{w}), 1071(\mathrm{~m}), 1032(\mathrm{~m}), 899(\mathrm{~m}), 745(\mathrm{~s})$ and $706(\mathrm{~s}) ; \delta_{\mathrm{H}}$ 1.92-1.97 ( $1 \mathrm{H}, \mathrm{m}, 4-\mathrm{CH}_{2 \mathrm{a}}$ ), 2.06-2.09 ( $1 \mathrm{H}, \mathrm{m}, 4-\mathrm{CH}_{2 \mathrm{~b}}$ ), 2.18-2.22 $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{a}}\right), 2.42-2.58$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2 \mathrm{~b}}\right), 2.82-2.86(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{CH}), 3.05\left(1 \mathrm{H}, \mathrm{dd}, J 10.4,3.8, \mathrm{OCH}_{2 \mathrm{a}}\right), 3.36(1 \mathrm{H}, \mathrm{dd}, J$ $\left.10.4,3.8, \mathrm{OCH}_{2 \mathrm{~b}}\right), 4.47-4.52(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}), 5.00-5.07\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}=\right), 5.66-5.73(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}=)$, 7.15-7.19 (3H, m, $3 \times \mathrm{ArH}$ ), 7.22-7.26 ( $6 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArH}$ ) and 7.34-7.39 ( $6 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArH}$ ); $\delta_{\mathrm{C}}$ 29.6, $35.2\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 39.0(3-\mathrm{CH}), 65.3\left(\mathrm{OCH}_{2}\right), 77.1(5-\mathrm{CH}), 87.1(\mathrm{C}), 117.8\left(\mathrm{CH}_{2}=\right), 127.2$ ( $3 \times \mathrm{ArCH}$ ), $127.9(6 \times \mathrm{ArCH}), 128.0(6 \times \mathrm{ArCH}), 134.5(\mathrm{CH}), 143.4(3 \mathrm{x} \mathrm{ArC})$ and 179.0

To a stirred solution of cyclohexene ( $1.00 \mathrm{~mL}, 9.81 \mathrm{mmol}$ ) in tetrahydrofuran ( 2 mL ) was added borane-methyl sulphide complex ( $0.46 \mathrm{~mL}, 4.9 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$ with stirring. After 1 h , the dialkyl $-\gamma$-butyrolactone $554(1.30 \mathrm{~g}, 3.27 \mathrm{mmol})$ in tetrahydrofuran $(5 \mathrm{~mL})$ was added to the mixture at $0^{\circ} \mathrm{C}$ and stirring was continued for 1 h at room temperature. The mixture was then treated with ethanol ( 2 mL ), followed by 3 N aqueous sodium hydroxide ( 1.5 mL ) and $35 \%$ aqueous hydrogen peroxide ( $2 \mathrm{~mL}, 17.98 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$ and the resulting mixture warmed to $50^{\circ} \mathrm{C}$ for 1 h . Cold water ( 8 mL ) was then added, the mixture was extracted with ether ( $2 \times 10 \mathrm{~mL}$ ) and the combined extracts were washed with brine ( 20 mL ), dried and evaporated to leave a colourless oil. The oil was dissolved in aqueous methanol ( $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$, $10: 1,5 \mathrm{~mL}$ ) and the solution refluxed with sodium hydroxide ( 0.45 g ) for 1 h . After evaporation of the solvent, the residue was dissolved in water ( 5 mL ) and the resulting solution washed with ether, acidified with acetic acid and extracted with dichloromethane. The organic extracts were washed with brine, dried and evaporated to give the crude alcohol 555 as a colourless oil $(1.09 \mathrm{~g}, 81 \%) ;[\alpha]_{\mathrm{D}}+18.7^{\circ}\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right) ; v_{\max } / \mathrm{cm}^{-1}[$ film $] 3396$ (br), $2930(\mathrm{~s}), 2865(\mathrm{~m}), 1760(\mathrm{~s}), 1448(\mathrm{~m}), 1190(\mathrm{~m}), 1070(\mathrm{~m}), 748(\mathrm{w})$ and $701(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.86$ $\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.29-1.61\left(6 \mathrm{H}, \mathrm{m}, 3 \mathrm{xCH}_{2}\right), 1.87-1.96\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.96-3.01(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{OH}\right), 3.49\left(1 \mathrm{H}, \mathrm{dd}, J 12.3,2.8, \mathrm{OCH}_{2 \mathrm{a}}\right), 3.74\left(1 \mathrm{H}, \mathrm{dd}, J 12.3,2.8, \mathrm{OCH}_{2 \mathrm{~b}}\right), 4.40-4.47(1 \mathrm{H}$, $\mathrm{m}, 5-\mathrm{CH})$, 7.11-7.18 (3H, m, $3 \times \mathrm{ArCH}$ ), 7.20-7.24 ( $6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}$ ) and 7.33-7.38 ( $6 \mathrm{H}, \mathrm{m}, 6$ $\mathrm{x} \operatorname{ArH}) ; \delta_{\mathrm{C}} 8.8\left(\mathrm{CH}_{3}\right), 25.0,29.7,29.9,33.1\left(4 \times \mathrm{CH}_{2}\right), 48.0(3-\mathrm{C}), 60.5,63.6\left(2 \times \mathrm{OCH}_{2}\right)$, $77.7(5-\mathrm{CH}), 86.5(\mathrm{C}), 126.9(3 \mathrm{x} \mathrm{ArCH}), 127.8(6 \mathrm{x} \mathrm{ArCH}), 128.7(6 \times \mathrm{ArCH}), 144.3(3 \mathrm{x}$ $\mathrm{ArC})$ and $181.0(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 427\left([\mathrm{M}-\mathrm{OH}]^{+}, 40\right), 243(100)$.

To a stirred solution of the 3-ethyl-3-hydroxypropyl-lactone $555(1.20 \mathrm{~g}, 2.7 \mathrm{mmol})$ in tetrahydrofuran ( 20 mL ) was added imidazole $(0.24 \mathrm{~g}, 3.456 \mathrm{mmol})$. After a clear solution was obtained, tert-butyldimethylsilyl chloride $(0.52 \mathrm{~g}, 3.456 \mathrm{mmol})$ was added to give a cloudy white solution. The mixture was allowed to stir for 16 h at room temperature, then quenched with water ( 20 mL ) and diluted with dichloromethane $(20 \mathrm{~mL})$. The organic layer was separated and washed with brine ( 20 mL ), then dried and evaporated to give the 3-silylated-propyl- $\gamma$-butyrolactone 556 as a light yellow oil ( $1.4 \mathrm{~g}, 93 \%$ ); $[\alpha]_{\mathrm{D}}+14.7^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3421 (br), 3064 (m), 2929 (s), 2856 (s), 1754 (s), 1596 (w), 1490 (m), $1449(\mathrm{~s}), 1254(\mathrm{~m}), 1192(\mathrm{~m}), 1089(\mathrm{~s}), 836(\mathrm{~m}), 767(\mathrm{~m})$ and $707(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.00(6 \mathrm{H}, \mathrm{s}, 2 \mathrm{x}$ $\left.\mathrm{SiCH}_{3}\right), 0.79-0.88\left(12 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{SiCCH}_{3}\right.$ and $\left.\mathrm{CH}_{3}\right), 1.52-1.62\left(6 \mathrm{H}, \mathrm{m}, 3 \mathrm{xCH}_{2}\right), 1.87-1.95(2 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{CH}_{2}\right), 3.10\left(1 \mathrm{H}, \mathrm{dd}, J 10.3,3.6, \mathrm{OCH}_{2 \mathrm{a}}\right), 3.22\left(1 \mathrm{H}, \mathrm{dd}, J 10.3,3.6, \mathrm{OCH}_{2 \mathrm{~b}}\right), 3.57-3.67(2 \mathrm{H}$, $\mathrm{m}, \mathrm{CH}_{2} \mathrm{O}$ ), 4.40-4.52 ( $1 \mathrm{H}, \mathrm{m}, 5-\mathrm{CH}$ ), 7.13-7.16 ( $3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH}$ ), 7.18-7.23 ( $6 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArH}$ ) and 7.30-7.35 ( $6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH}$ ); $\delta_{\mathrm{C}}-5.6\left(2 \times \mathrm{SiCH}_{3}\right), 8.9\left(\mathrm{CH}_{3}\right), 15.4(\mathrm{C}), 20.6\left(3 \times \mathrm{SiCCH}_{3}\right)$, $25.8,29.0,29.8,30.1\left(4 \mathrm{x} \mathrm{CH}_{2}\right), 47.6(3-\mathrm{C}), 66.5,68.8\left(2 \mathrm{x} \mathrm{OCH}_{2}\right), 78.6(5-\mathrm{CH}), 88.6(\mathrm{C})$, $126.5(3 \mathrm{x} \mathrm{ArCH}), 128.3(6 \mathrm{x} \mathrm{ArCH}), 128.9(6 \mathrm{x} \mathrm{ArCH}), 143.2(3 \times \mathrm{ArC})$ and $178.1(\mathrm{C}=\mathrm{O})$; $m / z[\mathrm{APcI}] 559\left([\mathrm{M}+\mathrm{H}]^{+}, 5\right), 427(10), 243$ (100); Found $[\mathrm{M}+\mathrm{H}]^{+}, 559.3238 . \mathrm{C}_{35} \mathrm{H}_{47} \mathrm{O}_{4} \mathrm{Si}$ requires $M, 559.3238$.

## (+)-(3S,5S)-3-Ethyl -3-(3'-(4-methoxybenzyloxy)-propyl) -5-trityloxymethyl- $\gamma$-butyrolactone 558

A stirred solution of the 3-ethyl-3-hydroxypropyl-lactone 555 ( $90 \mathrm{mg}, 0.20 \mathrm{mmol}$ ) in dichloromethane/cyclohexane ( $1: 2,1.5 \mathrm{~mL}$ ) was cooled to $0^{\circ} \mathrm{C}$ and treated sequentially with crude trichloroimidate $440(86 \mathrm{mg}, 0.30 \mathrm{mmol})$ and boron trifluoride etherate (one drop, catalytic amount). The mixture was warmed to room temperature and stirred for 16 h , then filtered through celite. The solid was washed with dichloromethane/cyclohexane (1:2, $2 \times 2$ mL ). The combined filtrates were washed with saturated aqueous sodium bicarbonate ( 2 mL ),
then dried and concentrated. The crude residue was purified by flash chromatography ( $40 \%$ ethyl acetate in petroleum ether) to give the p-methoxybenzyloxypropyl- $\gamma$-butyrolactone 558 as a pale yellow oil ( $68 \mathrm{mg}, 60 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.76$ ( $40 \%$ ethyl acetate in petroleum ether); $[\alpha]_{\mathrm{D}}+16.1^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3412 (br), 2945 (s), 2855 (s), 1730 (s), 1649 (m), 1613 (s), 1513 (s), 1447 (m), 1353 (w), 1298 (w), 1248 (s), 1175 (m), 1092 (w), 1034 (m), 823 (m), 764 (m) and $702(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.86\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.52-1.64\left(6 \mathrm{H}, \mathrm{m}, 3 \mathrm{x} \mathrm{CH}_{2}\right), 1.86-1.92\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, $3.13\left(1 \mathrm{H}, \mathrm{dd}, J 10.4,5.0, \mathrm{OCH}_{2 \mathrm{a}}\right), 3.20\left(1 \mathrm{H}, \mathrm{dd}, J 10.4,5.0, \mathrm{OCH}_{2 \mathrm{~b}}\right), 3.33(2 \mathrm{H}, \mathrm{td}, J 6.2,2.5$, $\left.\mathrm{CH}_{2} \mathrm{O}\right), 3.71\left(3 \mathrm{H}, \mathrm{s} \mathrm{OCH}_{3}\right), 4.31\left(2 \mathrm{H}, \mathrm{s}, \mathrm{Ar}-\mathrm{CH}_{2} \mathrm{O}\right), 4.32-4.51(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}), 6.78(2 \mathrm{H}, \mathrm{d}, J 6.8$, $2 \times \mathrm{ArH})$, 7.13-7.17 (5H, m, $5 \times \mathrm{ArH}$ ), 7.21-7.24 ( $6 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArCH}$ ) and $7.37(6 \mathrm{H}, \mathrm{d}, J 7.4,6$ $\mathrm{x} \mathrm{ArCH}) ; \delta_{\mathrm{C}} 8.8\left(\mathrm{CH}_{3}\right), 25.0,29.7,32.4,34.1\left(4 \mathrm{x} \mathrm{CH}_{2}\right), 47.7(3-\mathrm{C}), 55.3\left(\mathrm{Ar}-\mathrm{OCH}_{3}\right), 63.6$, $71.4,73.3\left(3 \times \mathrm{OCH}_{2}\right), 76.2(5-\mathrm{CH}), 86.5(\mathrm{C}), 113.9(2 \times \mathrm{ArCH}), 127.0(3 \mathrm{x} \mathrm{ArCH}), 127.8(6$ $\mathrm{x} \mathrm{ArCH}), 128.6(6 \mathrm{x} \mathrm{ArCH}), 130.5$ ( 2 x ArCH ), 144.3 ( 3 x ArC ), 159.3, $163.7(2 \times \mathrm{ArC}$ ) and $180.7(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 565\left([\mathrm{M}+\mathrm{H}]^{+}, 5\right), 243(100)$.
(S)-(O)-tert-Butyldiphenylsilyl- $\gamma$-hydroxymethyl- $\gamma$-butyrolactone 551 ${ }^{97 b}$

To a stirred solution of the hydroxymethyl- $\gamma$-butyrolactone $544(4.77 \mathrm{~g}, 41.12 \mathrm{mmol})$ in dichloromethane ( 45 mL ) was added triethylamine $(8.6 \mathrm{~mL}, 61.68 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$. After stirring for $10 \mathrm{~min}, t$-butyldiphenylsilyl chloride ( $11.76 \mathrm{~mL}, 45.23 \mathrm{mmol}$ ) and 4 dimethylaminopyridine (catalytic amount) were added and the resulting solution stirred at room temperature for 3.5 h . The mixture containing crystalline triethylamine hydrochloride was diluted with ether $(170 \mathrm{~mL})$ and water $(90 \mathrm{~mL})$. The separated ether solution was washed with water, 1 N HCl , aqueous sodium bicarbonate, brine and water, then dried and evaporated to leave a syrup, which was dissolved in warm hexane ( 90 mL ). Upon cooling, the product crystallized. Filtration and washing with hexane ( 25 mL ) gave crystalline t-butyldiphenylsilyl-$\gamma$-hydroxymethyl- $\gamma$-butyrolactone $551(10.20 \mathrm{~g}, 70 \%), \mathrm{mp} 74-76^{\circ} \mathrm{C}\left[\mathrm{Lit} \mathrm{F}^{97 \mathrm{~b}} \mathrm{mp} 75-79^{\circ} \mathrm{C}\right] ;[\alpha]_{\mathrm{D}}$ $+24.95^{\circ}\left(\mathrm{c} 1, \mathrm{CHCl}_{3}\right)\left[\mathrm{Lit}^{18}[\alpha]_{\mathrm{D}}+28.95^{\circ}\left(\mathrm{c} 2, \mathrm{CHCl}_{3}\right)\right] ; v_{\max } / \mathrm{cm}^{-1}[$ nujol $] 2933(\mathrm{~m}), 2857$ (m), 1777 ( s , 1472 (w), 1428 (w), 1361 (w), 1175 (m), 1113 (s), 996 (m), 942 (m), 823 (m), $743(\mathrm{~m})$ and $703(\mathrm{~s}) ; \delta_{\mathrm{H}} 1.07\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{SiCCH}_{3}\right), 2.25-2.33\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.54(1 \mathrm{H}$, ddd, $J$ $17.1,10.0,6.6, \mathrm{CH}_{2 \mathrm{a}}$ ), $2.71\left(1 \mathrm{H}\right.$, ddd, $\left.J 17.5,10.2,6.6, \mathrm{CH}_{2 \mathrm{~b}}\right), 3.70(1 \mathrm{H}, \mathrm{dd}, J 11.4,3.2$, $\mathrm{OCH}_{2 \mathrm{a}}$ ), $3.91\left(1 \mathrm{H}, \mathrm{dd}, J 11.4,3.2, \mathrm{OCH}_{2 \mathrm{~b}}\right), 4.43(1 \mathrm{H}$, dddd, $J 6.6,5.2,5.2,3.2, \mathrm{CH}), 7.40-7.49$
$(6 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArCH})$ and $7.67-7.69(4 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{ArCH}) ; \delta_{\mathrm{C}} 19.2(\mathrm{C}), 23.7\left(\mathrm{CH}_{2}\right), 26.7(3 \mathrm{x}$ $\left.\mathrm{CH}_{3}\right), 28.6,65.5\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 80.0(\mathrm{CH}), 127.9(4 \mathrm{x} \mathrm{ArCH}), 129.9(2 \times \mathrm{ArCH}), 132.5(2 \times \mathrm{ArC})$, 135.6, $135.7(4 \times \mathrm{ArCH})$ and $178.0(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 355\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 167(5), 158(5), 83$ (15), 71 (100). ## 1-(3'-Bromo-propoxymethyl)-4-methoxybenzene 561 ${ }^{98}$

A solution of 3-bromo-1-propanol ( $3.20 \mathrm{~mL}, 35 \mathrm{mmol}$ ) in dichloromethane/cyclohexane (1:2, 90 mL ) was cooled to $0^{\circ} \mathrm{C}$ and treated with crude trichloroimidate $440(10.62 \mathrm{~g}, 37.6 \mathrm{mmol})$ and camphorsulfonic acid ( 0.40 g , catalytic amount) over 30 min . After 3 h , the mixture was warmed to room temperature, stirred over 48 h and concentrated. Filtration of the crude residue through a short plug of silica (using $20 \%$ ethyl acetate in petroleum ether) afforded the corresponding p-methoxybenzyloxy ether 561 as a pale yellow oil ( $8.95 \mathrm{~g}, 99 \%$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3000 (m), 2934 (s), 2858 (s), 1732 (m), 1612 (s), 1586 (m), 1513 (s), 1464 (m), 1442 (m), 1362 (m), 1247 (s), 1173 (s), $1099(\mathrm{~s}), 1035(\mathrm{~s})$ and $821(\mathrm{~s}) ; \delta_{\mathrm{H}} 2.14\left(2 \mathrm{H}\right.$, pen, $J 6.2$, 2' $^{\prime}$ $\left.\mathrm{CH}_{2}\right), 3.54\left(2 \mathrm{H}, \mathrm{t}, J 6.2, \mathrm{CH}_{2}\right), 3.60\left(2 \mathrm{H}, \mathrm{t}, J 6.2, \mathrm{CH}_{2}\right), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.47(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{2}\right), 6.90(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArH})$ and $7.28(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 30.8,32.9\left(2 \times \mathrm{CH}_{2}\right)$, $55.3\left(\mathrm{OCH}_{3}\right), 67.4,72.8\left(2 \times \mathrm{OCH}_{2}\right), 113.8,129.3(4 \mathrm{x} \mathrm{ArCH})$ and $130.3,159.2(2 \mathrm{x} \mathrm{ArC})$; $m / z[\mathrm{APcI}] 259\left({ }^{79} \mathrm{Br} ;[\mathrm{M}+\mathrm{H}]^{+}, 80\right), 257(100), 228(25), 192(25)$. These data are consistent with those recorded in the literature. ${ }^{98}$

## 1-(3'-Iodo-propoxymethyl)-4-methoxy-benzene 562 ${ }^{98}$

To a stirred solution of sodium iodide ( $25.20 \mathrm{~g}, 0.168 \mathrm{~mol}$ ) in a minimum amount of anhydrous acetone was added the bromopropoxy ether 561 ( $8.70 \mathrm{~g}, 0.034 \mathrm{~mol}$ ). The mixture was refluxed for 4 h and then cooled to room temperature. Water $(30 \mathrm{~mL})$ was added and the mixture was extracted with pentane ( $2 \times 30 \mathrm{~mL}$ ). The combined extracts were washed with water ( 30 mL ), dried and concentrated. The concentrated crude was purified by flash chromatography ( $20 \%$ ethyl acetate in petroleum ether) to give the iodopropoxy ether 562 as a yellow syrup ( $8.50 \mathrm{~g}, 82 \%$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2949 (m), 2858 (m), 1612 (m), 1585 (w), 1513
(s), 1463 (w), $1302(\mathrm{w}), 1247(\mathrm{~s}), 1174(\mathrm{~m}), 1098(\mathrm{~m}), 1035(\mathrm{~m})$ and $820(\mathrm{w}) ; \delta_{\mathrm{H}} 2.00(2 \mathrm{H}$, pen, $\left.J 6.2,2^{\prime}-\mathrm{CH}_{2}\right), 3.22\left(2 \mathrm{H}, \mathrm{t}, J 6.2, \mathrm{CH}_{2}\right), 3.44\left(2 \mathrm{H}, \mathrm{t}, J 6.2, \mathrm{CH}_{2}\right), 3.74\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.38$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2}\right), 6.82(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \mathrm{x} \mathrm{ArH})$ and $7.19(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 3.7,33.5(2 \mathrm{x}$ $\left.\mathrm{CH}_{2}\right), 55.3\left(\mathrm{OCH}_{3}\right), 69.3,72.8\left(2 \times \mathrm{OCH}_{2}\right), 113.8,129.3(4 \mathrm{x} \mathrm{ArCH})$ and 130.3, $159.2(2 \mathrm{x}$ $\mathrm{ArC}) ; m / z$ [APcI] $259\left({ }^{79} \mathrm{Br} ;[\mathrm{M}+\mathrm{H}]^{+}, 80\right), 257$ (100), 228 (25), 192 (25). These data are consistent with those recorded in the literature. ${ }^{98}$

## (+)-(3R,5S)-5-(tert-Butyldiphenylsilanyloxymethyl)-3-[3'-(4-methoxy-benzyloxy)-propyl]-

 $\gamma$-butyrolactone 563

Diisopropylamine ( $1.34 \mathrm{~mL}, 9.88 \mathrm{mmol}$ ) was dissolved in anhydrous tetrahydrofuran ( 5 mL ) at $0^{\circ} \mathrm{C}$ under nitrogen. A solution of $1.6 \mathrm{M} n$-butyl lithium ( 6.2 mL in hexane, 9.88 mmol ) was added dropwise and the solution stirred at $0^{\circ} \mathrm{C}$ for 30 min . The lithium diisopropylamide thus formed was cooled to $-25^{\circ} \mathrm{C}$. The solution of the lactone $551(2.92 \mathrm{~g}, 8.23 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 30 mL ) was added dropwise, followed by hexamethylphosphoramide ( $1.7 \mathrm{~mL}, 9.87 \mathrm{mmol}$, ) and the resulting solution stirred at $-25^{\circ} \mathrm{C}$ for 1 h . Iodopropyl PMB ether $562(2.77 \mathrm{~g}, 9.05 \mathrm{mmol})$ was added and the reaction stirring at $-25^{\circ} \mathrm{C}$ for 3 h , then warmed to room temperature slowly and stirred for 16 h . The reaction was quenched by saturated aqueous ammonium chloride ( 10 mL ) and diluted with diethyl ether $(20 \mathrm{~mL})$. The layers were then separated and the organic layer washed with water ( $4 \times 30$ mL ), twice with brine and dried. Removal of the solvent on a rotary evaporator gave a crude product as a light yellow syrup. The concentrated crude was purified by flash chromatography ( $60 \%$ ethyl acetate in petroleum ether) to give the lactone 563 as a yellow syrup ( 2.70 g , $62 \%) ; \mathrm{R}_{\mathrm{f}} 0.65\left(60 \%\right.$ ethyl acetate in petroleum ether); $[\alpha]_{\mathrm{D}}+16.4^{\circ}$ (c $\left.1, \mathrm{CHCl}_{3}\right) ; v_{\max } / \mathrm{cm}^{-1}$ [film] 2929 (m), 2856 (m), 1769 (s), 1667 (w), 1612 (w), 1513 (m), 1472 (w), 1428 (m), 1360 (w), 1248 (s), 1171 (m), 1113 (s), 1031 (m), 823 (m) and $703(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.94\left(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{CH}_{3}\right)$,

## (+)-(3R,5S)-5-(tert-Butyldiphenylsilanyloxymethyl)-3-ethyl-3-[3-(4-methoxy-benzyloxy)-propyl]- $\gamma$-butyrolactone 564

Diisopropylamine ( $0.41 \mathrm{~mL}, 3.0 \mathrm{mmol}$ ) was dissolved in anhydrous tetrahydrofuran ( 2 mL ) at $0^{\circ} \mathrm{C}$ under nitrogen. A solution of $2.5 \mathrm{M} n$-butyllithium ( 1.2 mL in hexane, 3 mmol ) was added dropwise and the solution stirred at $0^{\circ} \mathrm{C}$ for 30 min . The lithium diisopropylamide thus formed was cooled to $-25^{\circ} \mathrm{C}$. A solution of the lactone $564(1.33 \mathrm{~g}, 2.5 \mathrm{mmol}$, in anhydrous tetrahydrofuran ( 15 mL ) was added dropwise, followed by 1,3-dimethyl-3,4,5,6-tetrahydro$2(1 \mathrm{H})$-pyrimidinone $\left(0.38 \mathrm{~g}, 3 \mathrm{mmol}\right.$, ) and the resulting solution stirred at $-25^{\circ} \mathrm{C}$ for 1 h . Iodoethane ( $0.28 \mathrm{~mL}, 3.5 \mathrm{mmol}$ ) was added and the mixture stirred at $-25^{\circ} \mathrm{C}$ for 3 h . The reaction mixture was then warmed to room temperature slowly and stirred for 16 h , then quenched by saturated aqueous ammonium chloride ( 15 mL ) and diluted with diethyl ether $(20 \mathrm{~mL})$. The layers were separated and the organic layer washed with water ( $3 \times 20 \mathrm{~mL}$ ), once with brine and dried. Removal of the solvent on a rotary evaporater gave a crude product, the lactone 564 as a brownish yellow oil ( 1.50 g , crude yield of $120 \%$ ); $[\alpha]_{\mathrm{D}}+14.5^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2934 (s), 2857 (s), 1767 (s), 1612 (w), 1513 (w), 1462 (w), $1428(\mathrm{~m}), 1358(\mathrm{w}), 1313(\mathrm{w}), 1248(\mathrm{~m}), 1192(\mathrm{~m}), 1113(\mathrm{~s}), 1032(\mathrm{~m}), 823(\mathrm{~m})$ and $703(\mathrm{~s}) ;$ $\delta_{\mathrm{H}} 0.87\left(3 \mathrm{H}, \mathrm{t}, J 7.4,10-\mathrm{CH}_{3}\right), 0.92(9 \mathrm{H}, \mathrm{s}, 3 \mathrm{x} \mathrm{SiCCH} 3), 1.51-1.65\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2}\right), 1.78-$ $1.84\left(3 \mathrm{H}, \mathrm{m}, 7-\mathrm{CH}_{2}\right.$ and $\left.4-\mathrm{CH}_{2 \mathrm{a}}\right), 2.01-2.10\left(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{CH}_{2 \mathrm{~b}}\right), 3.28\left(2 \mathrm{H}, \mathrm{td}, J 5.9,2.3, \mathrm{OCH}_{2}\right)$, $3.55\left(1 \mathrm{H}, \mathrm{dd}, J 11.4,4.4, \mathrm{SiOCH}_{2 \mathrm{a}}\right), 3.61-3.68\left(4 \mathrm{H}, \mathrm{m}, \mathrm{OCH}_{3}\right.$ and $\left.\mathrm{SiOCH}_{2 \mathrm{~b}}\right), 4.28-4.35(3 \mathrm{H}$, $\mathrm{m}, 5-\mathrm{H}$ and $\left.\mathrm{OCH}_{2} \mathrm{Ar}\right), 6.74(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArCH}), 7.09(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArCH}), 7.22-7.32$ $(6 \mathrm{H}, \mathrm{m}, 6 \mathrm{x} \mathrm{ArH})$ and $7.50-7.59(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{x} \mathrm{ArCH}) ; \delta 8.8\left(\mathrm{CH}_{3}\right), 19.2(\mathrm{C}), 24.8,25.6(2 \mathrm{x}$ $\mathrm{CH}_{2}$ ), $26.7\left(3 \mathrm{x} \mathrm{CH}_{3}\right), 29.8,32.3\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 47.8(3-\mathrm{C}), 55.3\left(\mathrm{OCH}_{3}\right), 68.0,70.0,72.6(3 \mathrm{x}$ $\mathrm{OCH}_{2}$ ), 77.2 ( $5-\mathrm{CH}$ ), 113.7 ( 2 x ArCH ), 127.8 ( 4 x ArCH ), 129.3 ( 2 x ArCH ), 129.9 ( 2 x ArCH), 130.5 (ArC), 132.8, 133.0 ( $2 \times \mathrm{ArC}$ ), 135.6, 135.7 ( $4 \times \mathrm{ArCH}$ ), 159.1 ( ArC ) and

 565

To a solution of the crude silylated lactone $564(1.40 \mathrm{~g}, 2.5 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 25 mL ) was added tetrabutylammonium fluoride ( 2.75 mLof 1 M solution in THF, 2.75 mmol ) dropwise at $0^{\circ} \mathrm{C}$. The mixture was allowed to stir for 16 h without further cooling, then quenched with water ( 25 mL ) and diluted with diethyl ether ( 50 mL ). The separated organic layer was washed with water $(3 \times 20 \mathrm{~mL})$ and dried. The concentrated crude was purified by flash chromatography ( $30-60 \%$ ethyl acetate in petroleum ether) to give the hydroxymethyl-lactone 565 as a colourless oil $(0.27 \mathrm{~g}, 33 \%) ; \mathrm{R}_{\mathrm{f}} 0.25$ ( $60 \%$ ethyl acetate in petroleum ether); $[\alpha]_{\mathrm{D}}+15.4^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\max } / \mathrm{cm}^{-1}[\mathrm{film}] 3470$ (br), 2917 (s), 2876 (s), 1761 (s), 1613 (m), 1513 (s), 1454 (m), 1358 (m), 1303 (m), 1248 (s), 1194 (s), 1098 (s), $1032(\mathrm{~s})$ and $819(\mathrm{w}) ; \delta_{\mathrm{H}} 0.87\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.35-1.72\left(6 \mathrm{H}, \mathrm{m}, 3 \mathrm{xCH}_{2}\right), 1.90(1 \mathrm{H}, \mathrm{dd}, J$ $13.1,8.3,4_{\mathrm{a}}-\mathrm{CH}_{2}$ ), $1.99\left(1 \mathrm{H}, \mathrm{dd}, J 13.1,8.3,4_{\mathrm{b}}-\mathrm{CH}_{2}\right), 3.36\left(2 \mathrm{H}, \mathrm{td}, J 6.1,1.4,3\right.$ ' $-\mathrm{OCH}_{2}$ ), $3.46\left(1 \mathrm{H}, \mathrm{dd}, J 12.5,4.1, \mathrm{OCH}_{2 \mathrm{a}}\right), 3.72\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArOCH}_{3}\right), 3.73\left(1 \mathrm{H}, \mathrm{dd}, J 12.5,4.1, \mathrm{OCH}_{2 \mathrm{~b}}\right)$, $4.33\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 4.40-4.46(1 \mathrm{H}, \mathrm{m}, 5-\mathrm{H}), 6.8(2 \mathrm{H}, \mathrm{d}, J 8.5,2 \mathrm{x} \mathrm{ArH})$ and $7.17(2 \mathrm{H}, \mathrm{d}, J$ 8.5, $2 \times \mathrm{ArH}$ ); $\delta_{\mathrm{C}} 8.7\left(\mathrm{CH}_{3}\right), 24.7,29.9,32.2,32.7\left(2 \mathrm{x} \mathrm{CH}_{2}\right), 47.9(3-\mathrm{C}), 55.3\left(\mathrm{OCH}_{3}\right), 64.0$, $70.0,72.6\left(3 \mathrm{x} \mathrm{OCH}_{2}\right), 77.7(5-\mathrm{CH}), 113.7(2 \mathrm{x} \mathrm{ArCH}), 129.4(2 \times \mathrm{ArCH}), 130.4159 .1(2 \mathrm{x}$ $\mathrm{ArC})$ and $180.9(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcI}] 323\left([\mathrm{M}+\mathrm{H}]^{+}, 10\right), 241.6(15), 191(15), 121$ (100), Found $[\mathrm{M}+\mathrm{H}]^{+}$, 323.1857. $\mathrm{C}_{18} \mathrm{H}_{27} \mathrm{O}_{5}$ requires $M, 323.1853$.
(+)-(3R,5S)-3-Ethyl-5-iodomethyl-3-[3'-(4-methoxy-benzyloxy)-propyl]- I- $\gamma$-butyrolactone
566

The hydroxymethyl lactone $565(0.20 \mathrm{~g}, 0.62 \mathrm{mmol})$ was dissolved in toluene ( 4 mL ). After the addition of imidazole ( $0.15 \mathrm{~g}, 1.5 \mathrm{mmol}$ ) and triphenylphosphine ( $0.20 \mathrm{~g}, 0.74 \mathrm{mmol}$ ), the solution was heated to $70^{\circ} \mathrm{C}$. At this temperature, iodine $(0.19 \mathrm{~g}, 0.74 \mathrm{mmol})$ was added and stirring continued for 2 h . The brown precipitate which formed was separated by decantation and the solution was evaporated to dryness. The residue was extracted with diethyl ether ( 3 x 2 mL ) and the solvent was evaporated and filtrated through a short plug of silica gel. The solvent was then evaporated to afford the iodolactone 566 as a yellow oil $(0.27 \mathrm{~g}, 99 \%)$ : $\mathrm{R}_{\mathrm{f}}$ $0.50\left(25 \%\right.$ ethyl acetate in petroleum ether); $[\alpha]_{\mathrm{D}}-16.8^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\max } / \mathrm{cm}^{-1}[$ film 2936 (s), 2875 (m), 1750 (s), 1611 (w), 1513 (s), 1459 (w), 1248 (s), 1173 (w), 1097 (m), 1036 (m), $919(\mathrm{w})$ and $819(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.89\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.55-1.66\left(6 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2}\right), 1.80(1 \mathrm{H}, \mathrm{dd}, J$ 13.3, 7.9, $4_{\mathrm{a}}-\mathrm{CH}_{2}$ ), $2.20\left(1 \mathrm{H}, \mathrm{dd}, J 13.3,7.9,4_{\mathrm{b}}-\mathrm{CH}_{2}\right), 3.14\left(1 \mathrm{H}, \mathrm{dd}, J 10.1,6.2, \mathrm{ICH}_{2 \mathrm{a}}\right.$ ), 3.33 $\left(1 \mathrm{H}, \mathrm{dd}, J 10.1,6.2, \mathrm{ICH}_{2 \mathrm{~b}}\right), 3.38\left(2 \mathrm{H}, \mathrm{m}, 3 \mathrm{H}-\mathrm{OCH}_{2}\right), 3.74\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArOCH}_{3}\right), 4.34-4.39(3 \mathrm{H}, \mathrm{m}$, $5-\mathrm{H}$ and $\left.\mathrm{OCH}_{2}\right), 6.8(2 \mathrm{H}, \mathrm{dt}, J 8.6,2.3,2 \mathrm{x} \mathrm{ArH})$ and $7.18(2 \mathrm{H}, \mathrm{d}, J 8.6, \mathrm{ArH}) ; \delta_{\mathrm{C}} 7.8\left(\mathrm{ICH}_{2}\right)$, $8.9\left(\mathrm{CH}_{3}\right), 24.9,29.9,32.1,32.7\left(4 \times \mathrm{CH}_{2}\right), 48.8(3-\mathrm{C}), 55.3\left(\mathrm{OCH}_{3}\right), 69.9,72.6\left(2 \times \mathrm{OCH}_{2}\right)$, $75.5(5-\mathrm{CH}), 113.8,129.3(4 \times \mathrm{ArCH}), 130.4159 .2(2 \mathrm{x} \mathrm{ArC})$ and $179.9(\mathrm{C}=\mathrm{O}) ; m / z$ [APcI] $433\left([\mathrm{M}+\mathrm{H}]^{+}, 30\right), 242(18), 122(100)$, Found $\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}, 450.1141 . \mathrm{C}_{18} \mathrm{H}_{29} \mathrm{INO}_{4}$ requires $M$, 450.1136.

## (-)-(2S)-2-Ethyl-2-[3'-(4-methoxy-benzyloxy)-propyl]-pent-4-enoic acid 567

To a stirred solution of the iodolactone $566(0.20 \mathrm{~g}, 0.46 \mathrm{mmol})$ in tetrahydrofuran ( 2 mL ), water ( 0.5 mL ) and acetic acid $(0.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added zinc powder ( $52 \mathrm{mg}, 0.8 \mathrm{mmol}$ ). The mixture was stirred vigorously at room temperature for 16 h . The resulting mixture was diluted with diethyl ether ( 2 mL ) and filtered through a pad of celite. The filtrate was concentrated and diluted with water ( 5 mL ) neutralized with aqueous $\mathrm{NaOH}(1 \mathrm{~N})$ and then extracted with dichloromethane ( $2 \times 5 \mathrm{~mL}$ ). The combined organic layers were then dried and concentrated to afford the acid 567 as a light yellow oil ( $0.135 \mathrm{~g}, 98 \%$ ); $[\alpha]_{\mathrm{D}}-3.7^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3657 (br), 2937 (s), 2871 (m), 1696 (m), 1611 (w), 1523 (s), 1456 (w), 1244 (s), 1172 (w), 1099 (m), 1036 (m), 917 (w) and $818(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.73\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right)$, $1.36-1.51\left(6 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2}\right), 2.19\left(2 \mathrm{H}, \mathrm{d}, J 7.4,3-\mathrm{CH}_{2}\right), 3.34\left(2 \mathrm{H}, \mathrm{t}, J 6.1, \mathrm{OCH}_{2}\right), 3.73(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{ArCH}_{3}\right), 4.29\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 4.99\left(1 \mathrm{H}, \mathrm{d}, J 10.0,5-\mathrm{CH}_{2 \mathrm{a}}\right), 5.02\left(1 \mathrm{H}, \mathrm{d}, J 17.0,5-\mathrm{CH}_{2 \mathrm{~b}}\right)$, $5.58(1 \mathrm{H}, \mathrm{ddt}, J 17.0,10.0,7.4,4-\mathrm{H}), 6.81(2 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH})$ and $7.18(2 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}) ; \delta_{\mathrm{C}}$ $8.4\left(\mathrm{CH}_{3}\right), 23.4,27.4,30.7,39.1\left(4 \times \mathrm{CH}_{2}\right), 49.1(2-\mathrm{C}), 55.3\left(\mathrm{OCH}_{3}\right), 70.3,72.5\left(2 \times \mathrm{OCH}_{2}\right)$, $113.8(2 \times \mathrm{ArCH}), 118.3\left(5-\mathrm{CH}_{2}=\right), 129.3(2 \times \mathrm{ArCH}), 130.5(\mathrm{ArC}), 133.6(4-\mathrm{CH}=), 159.1$ ( ArC ) and $182.9(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 307\left([\mathrm{M}+\mathrm{H}]^{+}, 15\right), 279(5), 191$ (25), 146 (75), 117 (60). (-)-(2S)-N-\{2-Ethyl-2-[3-(4-methoxy-benzyloxy)-propyl]-pent-4-enylidene\}-4-methylphenylsulfonamide 570

A suspension of tellurium powder $(0.22 \mathrm{~g}, 1.74 \mathrm{mmol})$ and chloramine-T $(0.54 \mathrm{~g}, 1.91 \mathrm{mmol})$ in toluene ( 5 mL ) was heated at reflux for 1 h , at which time the suspension become gray. The aldehyde $569(0.50 \mathrm{~g}, 1.74 \mathrm{mmol})$ in toluene $(2 \mathrm{~mL})$ was added and heating continued for 48 h. Dichloromethane ( 5 mL ) was added and the mixture filtered through celite. Removal of solvent in vacuo gave the $N$-tosylimine 570 as a yellow oil ( $0.77 \mathrm{~g}, 100 \%$ ), which was suitable for further use; $[\alpha]_{\mathrm{D}}-3.7^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $\mathrm{R}_{\mathrm{f}} 0.22(10 \%$ ethyl acetate in petroleum ether); $v_{\max } / \mathrm{cm}^{-1}$ [film] 2938 (m), 2855 (w), 1614 (m), 1513 (m), 1453 (w), 1325 (m), 1303 (w), 1247 (m), 1160 (s), 1091 (m), $1034(\mathrm{w}), 916(\mathrm{w}), 775(\mathrm{w})$ and $676(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.68\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right)$, 1.33-1.39 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}$ ), 1.46-1.54 (4H, m, $2 \times \mathrm{CH}_{2}$ ), $2.21\left(2 \mathrm{H}, \mathrm{d}, J 7.5,3{ }^{\prime}-\mathrm{CH}_{2}\right), 3.29(2 \mathrm{H}, \mathrm{t}, J$ $\left.6.3, \mathrm{CH}_{2} \mathrm{O}\right), 3.74\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.31\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 4.95\left(2 \mathrm{H}, \mathrm{dd}, J 17.4,12.0,5^{\prime}-\mathrm{CH}_{2 \mathrm{~b}}\right)$, $5.52(1 \mathrm{H}, \mathrm{ddt}, J 17.4,12.0,7.5,4-\mathrm{H}), 6.81(2 \mathrm{H}, \mathrm{dd}, J 8.6,1.8,2 \mathrm{x} \mathrm{ArH}), 7.18(2 \mathrm{H}, \mathrm{dd}, J 8.6$, $1.8,2 \mathrm{xArH}), 7.25(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \mathrm{x} \mathrm{ArH}), 7.72(2 \mathrm{H}, \mathrm{d}, J 8.2,2 \times \mathrm{ArH})$ and $8.33(1 \mathrm{H}, \mathrm{s}$, $\mathrm{CHN}) ; \delta_{\mathrm{C}} 7.2\left(\mathrm{CH}_{3}\right), 21.6\left(\mathrm{Ar}-\mathrm{CH}_{3}\right), 27.6,28.8,30.3,35.4\left(4 \mathrm{x} \mathrm{CH}_{2}\right), 39.0(2-\mathrm{C}), 55.3\left(\mathrm{OCH}_{3}\right)$, $64.4,65.7\left(2 \times \mathrm{OCH}_{2}\right), 113.7(2 \times \mathrm{ArCH}), 118.2\left(5^{\prime}-\mathrm{CH}_{2}=\right), 127.1(2 \times \mathrm{ArCH}), 127.7(\mathrm{ArC})$, 129.3 ( 2 x ArCH ), $129.9\left(4^{\prime}-\mathrm{CH}=\right), 134.3(2 \times \mathrm{ArCH}), 138.9,143.2,159.1(3 \times \mathrm{ArC})$ and $185.6(\mathrm{CHN}) ; m / z[\mathrm{APcI}] 444\left([\mathrm{M}+\mathrm{H}]^{+}, 30\right), 324$ (25), 273 (25), 153 (100), 121 (85). Found $[\mathrm{M}+\mathrm{H}]^{+}, 444.2202 . \mathrm{C}_{25} \mathrm{H}_{34} \mathrm{NO}_{4} \mathrm{~S}$ requires $M, 444.2203$.

## (+)-(2S)-Methyl 2-ethyl-2-[3'-(4-methoxy-benzyloxy)-propyl]-pent-4-enolate 575

To a stirred solution of the acid $567(100 \mathrm{mg}, 0.33 \mathrm{mmol})$ in acetone ( 1 mL ) was added potassium carbonate ( $68 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) followed by methyl iodide $(0.03 \mathrm{~mL}$ ), added dropwise at room temperature. The mixture was allowed to stir at $60^{\circ} \mathrm{C}$ for 16 h . After cooling the mixture to room temperature, it was evaporated to dryness. The residue was diluted with ether ( 2 mL ), washed with water and dried. Evaporation of the solvent gave the ester 575 as a colourless oil ( $100 \mathrm{mg}, 100 \%$ ); $[\alpha]_{\mathrm{D}}+4.0^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }} / \mathrm{cm}^{-1}[$ film] 2957 (s), 2856 (s), 1730 (s), 1614 (m), 1513 (s), 1462 (m), 1428 (m), 1360 (w), 1302 (w), 1247 (s), 1113 (s), $1036(\mathrm{~m}), 821(\mathrm{~s}), 743(\mathrm{~m})$ and $703(\mathrm{~s}) ; \delta_{\mathrm{H}} 0.71\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.42-1.54(6 \mathrm{H}, \mathrm{m}, 3 \mathrm{x}$ $\left.\mathrm{CH}_{2}\right), 2.26\left(2 \mathrm{H}, \mathrm{d}, J 7.4,3-\mathrm{CH}_{2}\right), 3.33\left(2 \mathrm{H}, \mathrm{t}, J 6.5, \mathrm{CH}_{2} \mathrm{O}\right), 3.57\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.72(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Ar}-\mathrm{OCH}_{3}\right), 4.34\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{Ar}\right), 4.95-5.03\left(2 \mathrm{H}, \mathrm{m}, 5-\mathrm{CH}_{2}\right), 5.76(1 \mathrm{H}, \mathrm{ddt}, J 15.0,10.1,7.5$, $4-\mathrm{H}), 6.80(2 \mathrm{H}, \mathrm{dd}, J 8.6,2 \mathrm{x} \mathrm{ArH})$ and $7.16-7.19(2 \mathrm{H}, \mathrm{m}, 2 \mathrm{x} \mathrm{ArH}) ; \delta_{\mathrm{C}} 8.5\left(\mathrm{CH}_{3}\right), 24.4,27.5$, 30.7, $38.0\left(4 \times \mathrm{CH}_{2}\right), 49.4(2-\mathrm{C}), 51.6,55.3\left(2 \mathrm{x} \mathrm{OCH}_{3}\right), 70.3,72.5\left(2 \mathrm{x} \mathrm{OCH}_{2}\right), 113.7(2 \mathrm{x}$ $\mathrm{ArCH}), 117.9\left(5-\mathrm{CH}_{2}=\right), 129.6(2 \mathrm{x} \mathrm{ArCH}), 130.6(\mathrm{ArC}), 133.8(4-\mathrm{CH}=), 135.3(\mathrm{ArC})$ and $177.1(\mathrm{C}=\mathrm{O}) ; m / z[\mathrm{APcl}] 321\left([\mathrm{M}+\mathrm{H}]^{+}, 15 \%\right), 279(5), 149(5), 121$ (100). Found $[\mathrm{M}+\mathrm{H}]^{+}$, 321.2058. $\mathrm{C}_{19} \mathrm{H}_{28} \mathrm{O}_{4}$ requires $M, 321.2060$.

## (+)-(2R)-2-Ethyl-2-(3'-hydroxy-propyl)-5-(4-methoxy-benzyloxy)-pentanoic acid 579

To a solution of cyclohexene ( $0.10 \mathrm{~mL}, 0.94 \mathrm{mmol}$ ) in tetrahydrofuran ( 1 mL ) was added borane-methyl sulphide complex ( $0.05 \mathrm{~mL}, 0.47 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$ with stirring. After 1 h , the ester $575(100 \mathrm{mg}, 0.31 \mathrm{mmol})$ in tetrahydrofuran $(1 \mathrm{~mL})$ was added to the mixture at $0^{\circ} \mathrm{C}$ and stirring was continued for 1 h at room temperature. The mixture was then treated with ethanol $(0.2 \mathrm{~mL})$, followed by 3 N aqueous sodium hydroxide ( 0.1 mL ) and $35 \%$ aqueous hydrogen peroxide $(0.2 \mathrm{~mL}, 1.72 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$. The mixture was then warmed to $50^{\circ} \mathrm{C}$ for 1 h . Cold water ( 1 mL ) was then added and the mixture extracted with ether ( $2 \times 1 \mathrm{~mL}$ ). The combined
extracts were washed with brine ( 2 mL ), dried and evaporated to leave a colourless oil. The oil was dissolved in aqueous methanol $\left(\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}, 10: 1,0.5 \mathrm{~mL}\right)$ and the solution refluxed with sodium hydroxide ( 0.05 g ) for 1 h . After evaporation of the solvent, the residue was extracted with water $(0.5 \mathrm{~mL})$ and the aqueous extract washed with ether, acidified with acetic acid and extracted with dichloromethane ( $2 \times 0.3 \mathrm{~mL}$ ). The organic extracts were washed with brine, dried and evaporated to give the crude hydroxy-acid 579 as a yellow oil ( $100 \mathrm{mg}, 94 \%$ ); $[\alpha]_{\mathrm{D}}$ $+13.5^{\circ}$ (c 1, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }} / \mathrm{cm}^{-1}$ [film] 3399 (b), 2933 (s), 2856 (s), 1698 ( s$), 1613$ (m), 1586 (w), 1514 (s), 1454 (m), 1362 (w), 1302 (m), 1248 (s), 1174 (m), 1092 (m), 1065 (m), 1036 $(\mathrm{m}), 968(\mathrm{w}), 821(\mathrm{~m}), 744(\mathrm{w})$ and $705(\mathrm{~m}) ; \delta_{\mathrm{H}} 0.74\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3}\right), 1.17-1.20(2 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2}$ ), 1.44-1.55 ( $4 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{CH}_{2}$ ), 1.64-1.66 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}$ ), 1.81-1.85 $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.36(2 \mathrm{H}$, $\left.\mathrm{t}, J 6.5,5-\mathrm{CH}_{2} \mathrm{O}\right), 3.51-3.57\left(2 \mathrm{H}, \mathrm{m}, 3^{\prime}-\mathrm{CH}_{2} \mathrm{O}\right), 3.72\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.34\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{Ar}\right)$, $6.80(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \mathrm{x} \mathrm{ArH})$ and $7.18(2 \mathrm{H}, \mathrm{d}, J 8.6,2 \times \mathrm{ArH}) ; \delta_{\mathrm{C}} 8.3\left(\mathrm{CH}_{3}\right), 24.2,25.4,27.1$, 29.9, 35.3 ( $5 \times \mathrm{CH}_{2}$ ), $48.6(2-\mathrm{C}), 55.3\left(\mathrm{OCH}_{3}\right), 62.9,70.3,72.5\left(3 \mathrm{x} \mathrm{OCH}_{2}\right), 113.8,129.3(4 \mathrm{x}$ $\mathrm{ArCH}), 130.4,159.1(2 \mathrm{x} \mathrm{ArC})$ and $176.9(\mathrm{C}=\mathrm{O}) ; \mathrm{m} / z[\mathrm{APcI}] 307$ ([M-OH] $\left.{ }^{+}, 15 \%\right), 191$ (15), 121 (100).

# A stereoselective synthesis of anti- $\gamma, \delta$-alkynyl- and -alkenyl- $\beta$-hydroxy- $\alpha$-amino esters from tin(II) enolates of glycinate $\dagger$ 

Jonathan J. Gridley, Michael P. Coogan, David W. Knight,* K. M. Abdul Malik, Christopher M. Sharland, Jirada Singkhonrat and Siân Williams<br>Chemistry Department, Cardiff University, P.O. Box 912, Cardiff, UK CFl0 3 TB.<br>E-mail: knightdw@cf.ac.uk;Fax: 44(0) 2920 874210; Tel: 44(0) 2920874210<br>Received (in Cambridge, UK) 3rd June 2003, Accepted 18th July 2003<br>First published as an Advance Article on the web 17th September 2003

Condensations between the tin(ii) enolate 11 of ethyl $N$ tosylglycinate and conjugated ynals 12 and ynones 14 are highly diastereoselective, in favour of the anti-isomers 13 and 15 ; similar reactions of enals and enones 17 show lower but still useful levels of anti-stereoselectivity.

Despite a plethora of recent advances in the synthesis of nonnatural and more highly functionalised $\alpha$-amino acid derivatives, ${ }^{1}$ there remains a need for the definition of practical and general approaches to such compounds. Not only are these of considerable importance as components of novel pharmaccuticals, but such densely functionalised compounds can find many applications in general synthesis. Doubtless with these ideas in mind, the Kazmaier group have carried out extensive studies of condensations between aldehydes and dianionic species derived from simple $N$-protected $\alpha$-amino esters. Variations in both the amine protecting group and the counter cations, unsurprisingly, were found to have profound effects on both the efficiency and stereoselectivity of such condensations. In general, these favour formation of an anti arrangement between the amino group and the new hydroxyl group. Of a number of alternatives, one of the best turned out to be a combination of the dilithio dianion 1 of N -Z-valine tert-butyl cster with 2 equiv. of $\mathrm{TiCl}\left(\mathrm{OPri}_{3}{ }_{3}\right.$ which provided, almost exclusively, the anti-diastereoisomer 2 when isobutanal was the electrophile, in $60 \%$ isolated yield (Scheme 1). ${ }^{2}$ These conditions were less successful with similar alanine derivatives but it was subsequently discovered that replacement of the titanium alkoxides with 2.5 equiv. tin(ii) chloride restored this excellent level of stereoselection, as well as giving improved yields. ${ }^{3}$ In addition, both $N$-tosyl and benzyl esters of alanine could be used to obtain the anti-diastercoisomers 3, but this generality was restricted to condensations with aliphatic aldehydes.

4
To achieve similarly high levels of stereoselection $(98: 2)$ with aromatic aldehydes, it was found essential to use a combination of $\mathrm{SnCl}_{2}$ and N -tosyl protection to obtain the antiisomers 4. The more easily removed $N$-SES group could be used cqually effectively.

A combination of the tin(n) enolate derived from $N$-tosyl alanine tert-butyl ester and a chiral $\alpha$-hydroxyaldehyde derivative resulted in excellent levels of asymmetric induction,

[^1]especially at the new $\beta$-hydroxyl centre. For example, such a reaction between $N$-tosyl alaninate 5 and aldehyde 6 gave essentially only the expected products 7 and 8 , in an $80: 20$ ratio (Scheme 2). Unfortunately, similar condensations involving glycinates gave products [e.g.9] which were epimeric at the $\alpha$ centre. This was explained by post-condensation epimerisation, rather than a lack of stereocontrol during the condensation, or its reversibility. ${ }^{4}$

11

The structures provided by this methodology were ideal for projected developments of our 5-endo cyclisation methodology aimed at the construction of pyrrolidines and pyrroles, ${ }^{5}$ given that it could be applied successfully to conjugated ynals and enals, types of electrophiles not examined by Kazmaier. Herein, we report that such condensations are indeed successful and also show synthetically very useful levels of stercoselection.

Our initial requirements were for a series of alkynyl- $\beta$ -hydroxy- $\alpha$-amino ester derivatives 10 . In view of the foregoing chemistry, it seemed possible that these could be obtained from the corresponding ynals and the tin(it) enolate of a glycinate. Such an intermediate has been formulated as structure 11; the requirement of a second equivalent of $\mathrm{SnCl}_{2}$ is ascribed to a role in electrophile activation. ${ }^{2-4}$ The required ynals 12 were obtained using the excellent method developed by Journet et al. by 1 -alkyne formylation (BuLi, THF; DMF; inverse quench) in around $90 \%$ yields. ${ }^{6}$ We were pleased to find that the desired condensations proceeded smoothly in THF, following mixing the reactants at $-70^{\circ} \mathrm{C}$ and warming to ambient temperature. ${ }^{2-4}$ Isolated yields of the hoped-for adducts 13 were between 60 and $83 \%$. Further, these were isolated as largely the anti-isomers, as shown (Scheme 3). This was a surprise, in view of the results

obtained from previous condensations with glycinates 11 (cf. 9). ${ }^{4}$ The anti : syn ratios were determined by integration of the ${ }^{1} \mathrm{H}$ NMR spectra of the crude products. These data also revealed that the remaining material balance from the condensations was largely N -tosyl glycinate, probably formed in most cases by competing deprotonation of the ynals 12 . In many cases, the major anti-isomers 13 could be separated by fractional crystallisation in $60-70 \%$ yields. Subsequent chemistry revealed that the adducts 13 were relatively prone to $\alpha$ epimerization and so we were somewhat nervous about structural determination by, for example, manipulation through to a cyclic structure. Fortunately, the anti-phenyl derivative [13; $\mathrm{R}=\mathrm{Ph}$ ] provided crystals suitable for X-ray analysis, ${ }^{7}$ which revealed the anti-stereoselection.
Thus encouraged, we carried out similar condensations using conjugated ynones 14 as the electrophiles. These too were successful and showed very useful levels of, again, antistereoselectivity (Scheme 4). 3-Butyn-2-one also condensed well with enolate 11, without the need to protect the potentially labile alkynyl proton, to give adduct 16 in similar yield and selectivity. Again, the pure anti-isomers could be separated by careful crystallization in $60-70 \%$ yields and the relative stereochemistry confirmed by X-ray analysis $[15 ; \mathrm{R}=$ Pri $] .{ }^{7}$

Finally, we briefly examined the outcome of such condensations when applied to enals and enones 17 . In general, these showed lower, but still useful, levels of anti-stereoselection in the expected products 18. These results are collected in Scheme $5 .{ }^{8}$

The high anti-stereoselectivity of the condensations between the glycinate enolate 11 and ynals 12 (Scheme 3 ) certainly fits

$R^{1}=P h, R^{2}=R^{3}=H(67 \%) ;$ antisyn $=80: 20 ;$
$\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}(69 \%)$; anti: syn $=63: 37$;
$\mathrm{R}^{1}=\mathrm{Bu}, \mathrm{R}^{2}=\mathrm{H}, \mathrm{R}^{3}=\mathrm{Me}(79 \%)$; anti. syn $=79: 21$.
$\mathrm{R}^{1}=\mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{Me}(91 \%)$; anti'syn $=70: 30 ;$
Scheme 5
well with Kazmaier's results and with his explanation based on a Felkin-Anh model. ${ }^{2-4}$ However, these results are not consistent with his conclusion that the mixture of adducts 9 , obtained from glycinate 11, was due to epimerization.
Uncertainties regarding the true nature of glycinate enolate 11 preclude much speculation. Indeed, the picture appears more complicated, because the condensations with ynones 14 gave adducts 15 with the same anti-selection, despite the larger substituent now being the " $R$ " group rather than the alkyne residue, in contrast to the related ynals 12 , especially when " $R$ " is branched [14; $\mathrm{R}=$ Pri]. Currently, one suggestion is that, if structure 11 is correct, the anti-stereoselection requires the alkyne group to be positioned axially, in a typical chair-like transition state 19. Could this be due to donation from the alkyne bond into vacant tin orbitals? The same effect could be responsible for the similar but lower anti-stereoselection of condensations with enals and enones 17. Of relevance is our observation, consistent with Kazmaier's, that condensations between enolate 11 and saturated aldehydes show almost no stereoselection. Hence, lack of complexation and not later epimerization may be responsible for this. Further studies aimed at shedding light on this along with synthetic applications of the various products reported herein are in progress.
