## Preface

## Acknowledgements

First of all I would like to thank my supervisor Professor Nick Lawrence, your expertise, guidance, and patience though out my PhD has been both inspirational and invaluable.

I would like to thank everyone at the Centre for Molecular Drug Design at the University of Salford who were involved in the cytotoxic testing of my compounds especially Dr. Sylvie Ducki and Darren Cook.

I am obliged to the Engineering and Physical Sciences Research Council for the funds necessary to carry out this research.

Likewise I am obliged to members of the technical staff at Cardiff University, and moreover Dr. Abdul Malik and Dr. Li-ling Ooi for their assistance in the collection of X-ray crystal data and Rob Jenkins for his assistance in the collection of NMR data.

I would like to thank the H. Lee Moffitt Cancer Center \& Research Institute for giving me the opportunity to work in the USA and express my gratitude to all off its staff for their support and making me feel welcome. I would especially like to thank Dr. Harshani Lawrence for all the help and advice she gave me in the lab. Acknowledgements also go to Professor Mark McLaughlin and his research group for the support they gave through out my stay in the USA. Again I am obliged to members of the technical staff at the H. Lee Moffitt Cancer Center \& Research Institute and the University of South Florida, especially Umut Oguz and Ted Gauthier for their assistance in the collection of NMR and mass spectroscopy data respectively. I would also like to thanks also Prof Jiandong Chen and Dr Hu Baoli for the p53-MDM2 bioassay and Prof Bhalla and Fei Guo for the bioassays of the KNK compounds.

I would like to express my appreciation for the past and present members of the Lawrence group. Especially Dan Pernazza, Argha Dutta, Chris Davies, Richard Patterson, Abdul Hannan, Nick Richards, Pedro Morchón, Ben Greedy, Roberta Pireddu, Huw Davies, Chris Rees and Suzanne Gregson. These are the people who have made my years in the group enjoyable and memorable. I would also like to thank Dr. Michael Coogan and his research group for sharing their lab space with me and to positively contributing to my experience in Cardiff.

Special thanks are expressed to those brave souls who have lived with me in Cardiff especially Neal Potter, Andrew Watts, and Dave King.

At this point I would also like to express my gratitude again to Nick Lawrence, Harshani Lawrence, Ben Greedy, Dan Pernazza, Roberta Pireddu and Nick Richards for being there

## Preface

during my American experience and surviving the Florida weather; with out you it wouldn't have been the same.

I would like to express my heart felt appreciation to all my family for all the love and support they have giving me over the last few years. Thanks to David, Susan, Jenny, Susan and Peter and the rest of my extended family, but most of all I want to thank Mother for everything she has given me, I am eternally grateful.

Finally I wish to thank Clare for constantly believing in me, encouraging me, and being there for me on every step of my journey; I couldn't have done it without you.

## Preface

#### Abstract

This thesis covers work investigating the design, synthesis and evaluation of Combretastatin A-4 like chalcones and their analogues, and other anticancer agents.

The first two chapters are an introduction to cancer chemotherapy and the development of tubulin as a target for chemotherapy. Chapter one includes information on cancer epidemiology, the history of cancer and the development of important cancer chemotherapy agents. While the second chapter describes the role of tubulin in mitosis, and the development of anticancer agents that target tubulin.

The third chapter describes the background to the chalcone project, as well as the design and synthesis of new Combretastatin A-4 like chalcones and their analogues. To further the investigation of the substitution of the $\alpha$-hydrogen of the chalcone with various groups, a series of $\alpha$-arylchalcones was synthesized. The substitution of $\alpha$-hydrogen with various aryl groups generally shows a significant increase in the anticancer activity of the chalcone. The effect of the conformation of the chalcone on its anticancer activity was also investigated by synthesizing two series of chalcone analogues which mimic the s-trans arrangement of chalcone, the indanones and indenones. Several of the indanones and indenones showed high levels of cytotoxicity with the CA-4 like indenone having an $\mathrm{IC}_{50}(\mathrm{~K} 562)$ value of $0.019 \mu \mathrm{M}$.

Chapter four looks at other chalcones with anticancer activity including the naturally occurring chalcone 4-hydroxyderricin, which has been isolated from the roots of Angelica keiskei and has shown to have anti-tumour promoting properties. As part of my PhD study the natural product 4-hydroxyderricin and a series of analogues was synthesized to investigate its anticancer activity.

In chapter five I synthesized the anticancer agent KNK437 which has been shown to be a dose dependant inhibitor of the acquisition of thermotolerance in several different tumours. The study found that KNK437 sensitizes human leukaemia cells to the 17-allylaminodemethoxy geldanamycin induced apoptosis.

Angiogenesis growth of new blood vessels from existing vasculature.
Apoptosis death of individual cells within a tissue as a result of normal cell turnover within a tissue or toxicity of an environmental agent.

Benign Not cancerous.
Cancer a malignant neoplasm.
Chromosome a structure within a cell nucleus of eukaryotes, consisting of DNA in association with proteins and other molecules.

Cytostatic inhibiting or suppressing cellular growth and multiplication
Cytotoxic cell-killing
Denaturation a structural change in macromolecules caused by extreme conditions.

## Preface

Differentiation make or become different in the process of growth or development.
Enzyme an organic catalyst, usually a protein in nature, that catalyses chemical reactions while in most cases remaining chemically unchanged.

Epidemiology the study of the incidence and distribution of diseases and other factors relating to health

Hormone a chemical made by glands in the body which control the actions of certain cells or organs

Hyperthermia a type of treatment in which body tissue is exposed to high temperatures to damage and kill cancer cells or to make cancer cells more sensitive to the effects of radiation and certain anticancer drugs.

Hypoxia a condition in which there is a decrease in the oxygen supply to a tissue.
Leukaemia a cancer that starts in blood-forming tissue such as the bone marrow, and causes large numbers of blood cells to be produced and enter the bloodstream.

Malignant tending to invade normal tissue or to recur after removal
Metastasis the dissemination and/or growth of cells originating from a primary neoplasm at another site.

Microfilament the smallest of fibrous cytoskeletal elements, which have diametres 30-60 $\AA$, lack periodicity, and are chemically related to actins.

Microtubule a widely occurring cylindrical cytoplasmic element 200 to $270 \AA$ in diametre and of variable length, increasing in number during mitosis.

Mitosis process resulting in the replication of cells which contain the same number of chromosomes as the parent cell.

Mutation a change in the structure and/or expression of a gene that is perpetuated in subsequent progeny of the cells in which it first occurred.

Neoplasm a heritably altered, relatively autonomous growth of tissue.
Tumour an abnormal mass of tissue that results when cells divide more than they should or do not die when they should. Tumours may be benign, or malignant.

## Chapter 1 - Cancer Chemotherapy

Cartoon booklet from the 1950s ${ }^{1}$

### 1.1 Introduction

In the late $19^{\text {th }}$ century tuberculosis, also know as the "great destroyer" and the "white plague", was the most feared disease of its time. In 1900 it killed 200 Americans per 100,000 of the population. But early on in the $20^{\text {th }}$ century due to advances in medical treatment and understanding of the disease, the number of cases started to drop as the disease was brought under control. When this happened the number of cases of cancer and heart disease related deaths started to increase. This was especially apparent in the elderly population.

### 1.2 Social awareness and cancerphobia in modern society of the US. ${ }^{1}$

At the turn of the $20^{\text {th }}$ century cancer was a disease that was beyond the ability of contemporary medical science to treat or even understand. One theory at the time was that cancer may be caused by germs and that it could be contagious, while other theories also

## Chapter 1 -Cancer Chemotherapy

included that it could be heredity, or that it may be caused by luxurious living, depraved sexual acts or even depression and mental stress. It was an indiscriminating killer, striking at random, caring not of race, class or age. One US physician described cancer as a "Loathsome beast, which seized upon the breast, drove its long claws into the surrounding tissues, derived its sustenance by sucking out the juices of it victims, and never even relaxed its hold in death." It became a social stigma, a disease that people would not talk about or see doctors if they suspected they had it, relatives of people who died of cancer often begged the coroner to record the death to be the cause of something else so the family would not be scandalized by it. Because of this, there was a general lack of hard evidence on the number of incidences and deaths each year. With such sentiments it is understandable why cancer became the new dread disease.

However by the mid 1930s the message of early detection and medical intervention was starting to spread, bringing a larger public interest. This led to several important news articles carried by Time, Life and Fortune and series of dedicated news reels shown in cinemas. In July 1937 a group of scientists and politicians secured $\$ 700,000$ to support cancer research and a further $\$ 750,000$ from the federal government, to build the National Cancer Institute in Bethesda, Maryland which would be a place to provide for and foster the continuous study of the cause, prevention, diagnosis and treatment of cancer. This action by the federal government strongly committed them to quest for the cure for cancer and further cancer research in the US.

By the late 1960s it was argued that the federal government needed to increase spending on cancer research. The price of scientific equipment was increasing faster than the increase in funds the government made to the NCI . The argument stated that in the 4 year course of the Vietnam War a total of 41,000 Americans had died, however in the last year over 320,000 Americans had died of cancer, and due to the war less money was being spent on scientific research. One writer noted that in one year America spent $\$ 410$ per capita on defense, $\$ 125$ on the war and only 89 cents on cancer research. With growing pressure and the chance to out flank one of his opponents, President Nixon made the following statement in his State of the Union message of January 1971 "The time has come when the same kind of concentrated effort that split the atom and took man to the moon should be turned towards conquering this dread disease. Let us make a total commitment to achieve this goal." On the $23^{\text {rd }}$ of December 1971 Nixon signed the National Cancer Act of 1971 into law; it stipulated that the NCI director was to be appointed directly by the president and to submit NCI financial requests to the budget office. Nixon also stated at the time that "I hope in years ahead we

## Chapter 1 - Cancer Chemotherapy

will be able to look back and see this action has been the most important action taken by this administration." By 1973 NCI funding had increased to over $\$ 400$ million, and by the end of the decade the funding had nearly reached a billion dollars.

### 1.3 Cancer Epidemiology

In the Western world cancer is the $2^{\text {nd }}$ leading cause of death after heart disease (Figure 1 ). In 2003 cancer accounted for over a quarter of the deaths in the UK, with 154,547 people registered as dying from cancerous tumours. ${ }^{2}$ In the USA it is estimated that there will be 570,280 deaths due to cancer in the year 2005, over 1500 deaths a day. ${ }^{2}$

Figure 1: Mortality Statistics in England and Wales - $2003^{2}$
It is estimated that 1 in every 3 people in the UK will develop some form of cancer during their life, with over quarter of a million new cases of cancer being diagnosed each year. Even though there are over 200 different types of cancer, only 4 of them account for over half the new cases, these are breast, lung, large bowel and prostate cancer (Figure 2). In recent years prostate cancer has overtaken lung cancer as the most commonly diagnosed cancer in UK male, with over 30,000 cases in 2001. The most prolific cancer in women is breast cancer, which is the highest occurring cancer in the British population, with over 40,000 in 2001. Children 14 years and younger count for less than $1 \%$ of total number of new cases of cancer each year. Nearly two thirds of all the new cases of cancer are diagnosed in those aged 65 and older. With a growing elderly population due to increased life expectancy, it is predicted that by the year 2025, there will be an extra 100,000 incidences a year. ${ }^{2}$

## Chapter 1 - Cancer Chemotherapy

Figure 2: The 10 most commonly diagnosed cancers in the UK - $2001^{2}$
In the UK cancer of the lungs, bowel, breast and prostate account for nearly half of all the cancer related deaths (Figure 3). Even with the decreasing number of annual incidences of lung cancer it is still accountable for over a fifth of the annual cancer deaths. More than three quarters of deaths due to cancer occur to persons aged 65 and over. However cancer accounts for over two fifths of the deaths in the population under 65 years old, and outnumbers the deaths due to circulatory systems including stroke and ischaemic heart disease. ${ }^{2}$

Despite the increasing number of incidents a year, the overall mortality rate from cancer is going down. From 1994 to 2003 the age standardized mortality rate from cancerous tumours has dropped by $13 \%$ for men and $10 \%$ for women. For instance there have been 1758 fewer deaths due to breast cancer in 2003 than 1994, even though there has been an increase in the number of incidences for breast cancer. ${ }^{2}$

## Chapter 1 - Cancer Chemotherapy

Figure 3: The 10 most common causes of death from cancer in the UK $-2003^{2}$
As well as the previously mentioned drop in cancer related mortality rate, the 5-year survival rate for people diagnosed with cancer in the US has also increased from 50\% in 1974-1976 to $64 \%$ in 1995-2000. These 5 -year survival rates vary greatly depending on the type of cancer, for instance the largest increase has been for prostate cancer, the 5 -year survival rate was increased to $99 \%$ in 1995-2000 from $67 \%$ in 1974-1976. However there has been a small decrease in the 5-year survival rates for cancers of the larynx and uterine corpus. ${ }^{2}$

Tobacco smoking has been identified as the single most important cause of preventable cancer in the UK, and is linked to one third of the annual cancer related deaths. ${ }^{2}$ While in the US over one third of all cancer deaths are linked to nutrition, physical inactivity and weight/obesity, all of which are preventable. ${ }^{2}$ A study done on the factors that contribute to cancer in the US by R. Doll and R. Peto ${ }^{3}$ in 1981 (Figure 4) shows that a large percentage of these risks can be reduced by taking proper precautions. It has been suggested that pollution and occupation exposure to carcinogenic sources are relatively low risk factors when compared to our own lifestyle choices such as smoking, diet, alcohol consumption, sexual behaviour and exposure to sunlight.

## Chapter 1 - Cancer Chemotherapy

Figure 4: Proportions of cancer deaths attributed to various different factors. ${ }^{3}$
Another way to lower the risks of terminal cancer is early detection from regular screening/examination. If a cancer can be caught early treatment is likely to be far more successful. Screening can detect cancers of the breast, colon, rectum, cervix, prostate, oral cavity and skin.

### 1.4 The History of Cancer. ${ }^{4}$

Cancer is often thought of as a modern disease, however traces of tumour have been found in fossil remains of dinosaurs from the Cretaceous period, 144 to 65 million years ago. ${ }^{5}$ The earliest recorded history of the treatment of cancer is in the Ebers Papyrus (Figure 5). The Ebers Papyrus is ancient Egyptian medical scroll dating from around 1500 BC ; it is over 20 metres long and details over 700 medical magic's using different animal and plant extracts as well as surgery. The scrolls show evidence of Egyptian surgeons regularly identifying and removing tumours. ${ }^{\text {b }}$ There are also a number of tomb paintings showing evidence of tumours.

Figure 4: Frontispiece of the Ebers Papyrus. ${ }^{6}$

Hippocrates ( $460 \mathrm{BC}-380 \mathrm{BC}$ ) noted in his Aphorisms about the dangers of cancer spreading due to incomplete surgery. Also it was Hippocrates who described a tumour as

## Chapter 1 - Cancer Chemotherapy

being crab like due to the distended veins radiating from central lump, the Greek word for crabs being Karkinoma, which when translated to Latin becomes cancer. ${ }^{1}$

On a similar note the Roman physician Celsus ( $25 \mathrm{BC}-50 \mathrm{AD}$ ) also recommended surgery for early diagnosed tumours, claiming late intervention would aggravate the situation.

The Greek medical writer Galen (131 AD - 201 AD ) provided exact instructions in his books, the therapeutic method on the removal of tumours. "When a tumour has risen to a noticeable size, there is no cure without surgery. The goal is to proceed with a round incision so that the entire tumour can be excised." Galen's medical views dominated European medicine for over a thousand years, cancer and all aliments were thought to be caused by an imbalance in the four body humours: blood, phlegm, black bile and yellow bile. The cause of cancer was said to be due to a concentration of black bile.

Cancer was a rare disease in Hippocrates and Galen's time due to the average life span being much shorter then, $30-40$ years, with modern day cancer happening most frequently to the people aged 65 and over. Physician and surgeons of this time were far more concerned with treatment of injuries from battles, sexually transmitted diseases and food poisoning. The true causes of cancer remained a mystery until the $19^{\text {th }}$ century.

The Italian physician Bernardino Ramazzini, carried out the first study of cancer in the early $18^{\text {th }}$ century. He noted that nuns have a much higher incident rate of breast cancer compared to mothers who had breast fed their children. At the time no one knew of the importance of hormones and the development of breast cancer.Also in the $18^{\text {th }}$ century an English physician John Hill ${ }^{7}$ commented on snuff users getting nasal cancer; this was probably the first link of cancer and tobacco. But it was Percivall Pott ${ }^{8}$ in 1775, who reported that boys who had worked as chimney sweeps, often developed scrotal cancer later on in life. This was first link between environmental carcinogens in this case, soot and cancer. Despite this warning, the practice of small boys cleaning chimney flues continued for a further hundred years before it became illegal, and even then it was due to humanitarian rights rather than health issues.

The discovery that organisms were made of cells which divide to replicate themselves in the 1850s - 1860s by European scientists, especially the German Rudolf Virchow revolutionized medical theory. The idea that all cells come from pre-existing cells eliminated the accepted ideas of Galen's theories on the bodies 4 humours. Virchow stated that cancer cells sprung from other cells in the body, just like any other cells. But unlike normal cells their growth was anarchic, invasive, metastatic and all too often disastrous. Later researchers disproved some of Virchow's theories on the origins of some cancers; however no one was able to

## Chapter 1 - Cancer Chemotherapy

describe the reason why some cells became cancerous. This remained a mystery. Near the end of the $19^{\text {th }}$ century a leading Philadelphia surgeon, Samuel Gross admitted that the basic questions of what cancers were and how they developed were simply beyond contemporary medical science. ${ }^{1}$

Virchow also speculated that cells that were exposed to certain irritants would be more prone to developing cancer cells. This helped to explain why some habits such as smoking tobacco seemed to provoke the disease. This idea also worked well to explain the link between chemical exposure and cancer. In the late $19^{\text {th }}$ century these links became more apparent with increased cases of skin cancers in workers employed in the paraffin, tar and oil industry in the north of England and Scotland. Another case of exposure to hazardous materials occurred to German miners who were contracting lung cancer. The idea at the time was that mine dust was to blame, but the tumours were probably due to the presence of radioactive pitchblende, a mineral which contains radium. ${ }^{1}$

The first scientific proof between chemical exposure and cancer came from a study done by Yamagiwa \& Ichikawa ${ }^{9}$ in 1915, where they had produced malignant tumours on the ears of rabbits by applying coal tar to them. Similar experiments were carried out on mice by Passey ${ }^{10}$ who smeared them with an extract of soot and reported the growth of malignant tumours.

### 1.5 How does a normal cell become a cancer cell?

The average adult is made up of 30 million million ( $3 \times 10^{12}$ ) cells which can all undergo mitosis to produce two new cells which can replace dead or damaged cells. But during mitosis there are numerous points where a mistake can occur or where the delicate control mechanism can break down, this can lead to a number of events where a normal cell can be turned into a rogue cell and perhaps a cancer cell.

Two particular types of genes have the main responsibility of controlling the life cycle of a cell. These are the proto-oncogenes such as src protein and ras protein, the other being tumour suppressor genes like p53. The proto-oncogenes control the growth, differentiation (to change the function of a cell) and proliferation (rapid reproduction) of cells. While tumour suppressor genes code for the production of proteins that control DNA transcription, DNA repair, and are key components in biological pathways activated in response to DNA damage which will stop the cell from growing and undergo apoptosis. Damage to genes can occur through the effects of carcinogens, viruses and ionizing radiation and will disrupt their normal function. Proto-oncogenes when mutated will become an oncogene. Oncogenes are

## Chapter 1 - Cancer Chemotherapy

formed by a minor DNA sequence change to the proto-oncogenes; one amino acids difference will completely change the activity of the encoded enzyme and can ensure that the cell is constantly activated for growth and proliferation. In about half of tumours, tumour suppressors are found to be mutated. This ensures that the growth of the cell is uncontrolled and does not undergo apoptosis.

One of these mutations will not instantly cause tumour growth, normally half a dozen such mutations must accumulate before the tumour cell line is established. Even then the tumour may not be cancerous and will remain benign and localized; such tumours can be dealt with by surgery or destroyed via irradiation. For a tumour to become malignant it must undergo a process know as metastasis where it will become invasive and spread through out the body. To become invasive the localized tumour must overcome several more control systems and enter the bloodstream or lymphatic system. Once the tumour has become malignant it can only be treated with chemotherapy to stop the spread of the disease through out the body.

So how do cancer cells migrate when normal cells stay in the same place? Normal cells release adhesion molecules which bind them to their neighbours and the underlying structure of the body, the extracellular matrix. However in cancer cells these adhesion molecules are missing or have a higher affinity for the tissues that they came from, also cancer cells can avoid detection and therefore destruction by white blood cells. A better understanding of how these migrations take place will help in fight against cancer.

### 1.6 Cancer Chemotherapy

In the past 25 years there have been major advancements in surgery and radiotherapy in the treatment of cancer, but the most progress has been made in the field of chemotherapy. At the time of detection a tumour will probably weigh about a gram and be about one billion cells ( $1 \times 10^{9}$ cells). The overall strategy to deal with tumours is to eliminate $99.999 \%$ of it, leaving around ten thousand cells ( $1 \times 10^{4}$ cells) where hopefully the bodies immune system will destroy the remaining cells. However if a single cell remains it can reproduce itself again and start another tumour. The time taken for a tumour to double in size varies greatly, for instant people who have Hodgkin's lymphoma will only have a short remission time because the tumour doubles in 3-4 days, while the remission time for breast cancer can be $10-15$ years before a tumour re-emerges, this is due to the long doubling time of $80-100$ days. Anticancer drugs are most effective against cells that are going though mitosis, and therefore cancers with short remission times are the easiest to cure compared to ones with long remission time, this is because the cells are more frequently in the mitosis stage.

## Chapter 1 - Cancer Chemotherapy

### 1.6.1 The Mustard Gases

Mustard gas, bis(2-chloroethyl)sulfane (1), was first used by the Germans against the Allies in the $1^{\text {st }}$ world war on the night of $12 / 13$ July 1917. By the end of July it had claimed 15,000 causalities, by the end of the war a further 125,000 casualities would be caused by the use of mustards. People who had been exposed suffered with severe eye irritation which could lead to blindness and would get a rash that turned to blisters. After 4 weeks, the blisters would burst and then if they became infected, it would take a further 5 to 6 weeks to heal. Also many of the exposed also suffered with inflamed throats and subsequent lung problems. ${ }^{4}$

However mustard gases were not made with the intention of killing, only to sow panic and confusion. Between the wars further research was done on the mustards to examine their properties. ${ }^{11.12}$ Various nitrogen analogues of mustard gas was made. They were found to have similar blistering properties and were also found to be toxic to many cells of the body, especially cells going through mitosis. ${ }^{13}$

Research done at Yale University showed that mice bearing tumours that were treated with N -mustard analogues showed almost immediate effects and the tumours shrunk and eventually disappeared, only to reappear a month later. Subsequent treatments proved to be less successful; this was thought to be due to drug resistance. ${ }^{13}$

In August 1942 a man with terminal lymphoma whose tumours had stopped responding to radiotherapy was giving a 10 day treatment with the nitrogen mustard, tris(2chloroethyl)amine (2). After 7 days the tumours which had covered his chest, neck and lower face had completely disappeared. However like the mice this was only temporary and he died 3 months later. Further clinical trials with 2 were done and another 5 people showed similar responses. A more widespread clinical trial took place with mechlorethamine (3) with over 150 patients and showed results against various lymphomas and leukaemias. ${ }^{13}$ It proved to be especially affective against Hodgkin's lymphoma with one patient being in remission for 3 years upon being given periodic doses of 3 .

## Chapter 1-Cancer Chemotherapy

The side effects of the mustards include suppression of the bone marrow and therefore careful dosage due to the toxicity of the compounds was required. But they did not cause vomiting which is common with other anticancer drugs. In 1946 the first paper on this subject was released in Science, detailing the therapeutic results of 3. This was the first the public knew of this because until then all the research had be done in secret due to the war. ${ }^{13}$ The paper stated that only two nitrogen mustards had been tested so far, of literally hundreds of possible analogues. Over the next few years several improvements were made with drugs like Chlorambucil (4) and Melphalan (5) being water soluble and orally active. The most successful nitrogen mustard is Cyclophosphamide (6), which was designed as a prodrug to target prostate cancer. Designed to release 1, the actual mechanism of activation proved to be more complex. Cytochrome P-450, in the liver, is thought to oxidize C-4 of the prodrug 6 to give 4-hydroxycyclophosphamide (6a). This hemiaminal exists in equilibrium with the aldehyde 6b. The aldehyde then undergoes a retro-Michael reaction to give the true alkylating agent phosphoramide mustard (6c) and acrolein (6d) (Scheme 1). ${ }^{14.15}$ It was found to be highly active against a whole range of cancers. It can be taken orally and remains active in the body for up to 48 hours and has none of the adverse blistering effects that the early mustards had. Side effects from the mustards include bone marrow toxicity,

6d

Scheme 1 hair loss and a reduction in fertility.

The mode of action of these compounds involves nucleic acid alkylation and they are therefore described as alkylating agents. DNA exists in a double helical structure and for a cell to replicate itself, the DNA strands needs to be unwound so that they can be copied. The nitrogen mustards and other related alkylating agents work by reacting with various groups on the DNA. When this takes place it changes the structure of the DNA, it also leads to the alkylating agents making inter and intra cross links on the DNA, which will prevent the DNA from being unwound. For example mechlorethamine (3) eliminates a chlorine anion by an internal nucleophilic attack to produce the reactive species 3a. The product can then react with the electron donor groups within DNA (7) such as the nitrogen 7 on guanine to form covalent bonds. The alkylated mustard can then form another azirdinium species which can then react with a further guanine to cross link the DNA (Scheme 2).

## Chapter 1 - Cancer Chemotherapy

Scheme 2

### 1.6.2 Platinum Complexes

The next class of alkylating agent was found again by serendipity. In 1965, Prof. Barnett Rosenberg of the Biophysics Department at Michigan State University was investigating the effects of an electric current on cell division
 in cultures of Escherichia coli. He found that in the presence of platinum electrodes, ammonium chloride and oxygen that the bacteria cells did not undergo mitosis. He proposed that the acidified chloride salts attacked the platinum electrodes during electrolysis causing it to form a soluble platinum salt which could disrupt mitosis. Several experiments were then
 carried out to prove this idea and it was reported that mitosis was prevented in the presence of $\mathrm{PtCl}_{6}\left(\mathrm{NH}_{4}\right)_{2}$ and several other transition metal salts. ${ }^{16}$ Further research showed $\mathrm{PtCl}_{6}\left(\mathrm{NH}_{4}\right)_{2}$ was unstable and that it was cis-diaminodichloroplatinate (8) (now known as cisplatin) which prevented mitosis at concentrations as low as $5 \mathrm{ppm} .^{1}$ Further research by Rosenberg's coworker Loretta Van Camp showed that cisplatin (8) had anticancer activity on tumours in mice.

Figure 5: X-ray crystal structure of DNA containing a cross linked Cisplatin ${ }^{1 \times}$

## Chapter 1 -Cancer Chemotherapy

By 1973 preliminary results on humans with 8 had shown it to be highly effective at treating testicular cancer, and certain ovarian cancers. The side effects were high toxicity to the kidney and severe vomiting, but it had only a little toxicity to the bone marrow. By 1986 a new less toxic analogue of 8 was licensed for clinical use, known as carboplatin (9). The modes of action for these platinum complexes have been shown to be similar to that of the mustards and are also alkylating agents (Figure 5) where the nitrogen 7 on guanine (7) forms a covalent bond to the platinum complex, displacing a chlorine atom from 8 . The X-ray crystal structure ${ }^{18}$ (Figure 5) shows two separate stands of DNA one in blue, the other in green which have been cross-linked by the platinum complex (shown in red) from the nitrogen at position 7 on guanines of each strand of DNA.

### 1.6.3 Antimetabolites and the cure for Leukaemia

Leukaemia is caused through uncontrolled proliferation of the white blood cells, it is a common childhood cancer. Fifty years ago, the life expectancy for patients with leukemia was 3 to 4 months. With modern treatments, nearly $80 \%$ of all children go on to survive for 5 years, and most make a full recovery.

The breakthrough in the treatment of leukaemia started with the study of antimetabolites which disrupt cellular function due to the similarity of these compounds with cellular metabolites. Previous studies on leukaemia patients showed that the disease was accelerated when they were treated with folic acid (10) conjugates. ${ }^{19}$ This led Farber to believe that using antifolates (folic acid antagonists) might be effective in treating leukaemia cases. In 1947 Farber found that 10 out 16 children with leukaemia responded favourably to the antifolate, aminopterin (11), going into full remission. However this remission was only temporary and repeated treatments with aminopterin had no effect. ${ }^{20}$ The use of aminopterin (11) caused ulceration to the mouth and left the patient at risk of infection due to their immune system being compromised. Aminopterin (11) was soon replaced with the safer drug methotrexate (12), which had first been synthesized by Seeger. ${ }^{21}$

## Chapter 1 - Cancer Chemotherapy

Synthesis of the nucleotide thymidine (13) which is needed for the synthesis of DNA, requires the reduction of dihydrofolic acid (14) to tetrahydrofolic acid (15) by dihydrofolate reductase (DHFR) (Scheme 3). The antifolates aminopterin (11) and methotrexate (12) are dihydrofolate analogues which bind to DHFR and inhibits DHFR reduction of 14 , this halts the synthesis of DNA by disrupting the synthesis of the nucleotide thymidine (13) and cause apoptosis. ${ }^{22}$

Scheme 3: The Folate Catalytic Cycle
The methylation mechanism of thymidylate synthase (Scheme 4) starts with the Michael attack of cysteine residue at the C 6 position of the uridine (16) to form the enolate 17 . The tetrahydrofolate (18) is then activated by iminium ion 19 formation via acid catalysis. The methylene group of the activated tetrahydrofolate iminium ion 19 then forms a bond with the enolate 17 at its C5 position, giving the methylene bridged product 20. The proton on the C5 position of 20 is then deprotonated and the compound undergoes a ElcB elimination of tetrahydrofolic acid (15), via the enol 21, leaving the methylene group attached to C5 of 22. The methylene group of 22 is then reduced by the tetrahydrofolic acid (15) and releases the thioenzyme, giving the newly formed thymidine (13) and dihydrofolic acid (14) which is then recycled back tetrahydrofolate (18) again using the folate catalytic cycle (Scheme 3). ${ }^{23}$

## Chapter 1 - Cancer Chemotherapy

Scheme 4: The mechanism of Thymidylate Synthase
With the success of the antifolates, research was done into the other 2 antimetabolites, antipurines and antipyrimidines. Pioneering work on antipurines carried out by Elion and Hitchings in the late 1940s and early 1950s led to the initial development of antipurines as anticancer agents. ${ }^{24}$ At this time the basic knowledge of the nucleic acids was rather rudimentary. Watson and Crick's publications on DNA were released in 1953. ${ }^{25}$ Hitching theorized that it might be possible to stop the growth of rapidly dividing cells with antipurines because they would interfere with nucleic acid synthesis. By 1948, 2,6-diaminopurine (23) was found to inhibit the growth of the microorganism Lactobacillus casei, the inhibition could be reversed by the addition of adenine (24). From this they deduced that adenine and 2,6-diaminopurine were anabolized by the same enzyme and somehow the diaminopurine interfered with purine interconversion. Further testing showed that 2,6-diaminopurine was a strong inhibitor of aldo keto reductase (AKR) mouse leukaemia. Unfortunately 2,6diaminopurine proved to be too toxic for clinical trials, producing severe nausea and severe

## Chapter 1 - Cancer Chemotherapy

bone marrow depression. By 1951 over 100 purine analogues had been tested in the screen against Lactobacillus casei, the substitution of the oxygen by sulfur at the 6 position of guanine (25) produced 6-mercaptopurine (26) and 6-thioguanine (27) which proved to be active against a wide range of rodent tumours and leukaemias.

23

24

25

26

27

In 1953 the Food and Drug Administration approved 6-mercaptopurine (26) for general use, after clinical trials showed that it could induce complete remission in acute leukaemia in children, however most of the cases would eventually relapse. Today 6-mercaptopurine (26) is used in combination chemotherapy with other drugs, including methotrexate (12) and induces remission in nearly $80 \%$ of all children with acute leukaemia. Hitchings and Elion were awarded the Nobel Prize in 1988 for there advances in finding anticancer drugs.

Other purine and pyrimidine analogues have also shown anticancer activity. Prof Heidelberger at McArdle Memorial Labs at the University of Wisconsin in 1957 reported that the analogue of uracil (16), 5-fluorouracil (28) showed tumour inhibitory properties. ${ }^{26}$ 5-Fluorouracil (28) was first synthesized at Hoffmann-La Roche, Nutley, New Jersey in 1957. ${ }^{27}$ Heidelberger chose to make analogues of uracil

13

16

28 because he believed that uracil was a precursor to thymidine (13) which is a key component of DNA. His idea for replacing the hydrogen for fluorine, came from the difference between acetic acid and fluoroacetic acid (which is highly toxic), and that the same may be true of uracil. Clinical trials of 5 -fluorouracil (28) have shown it to be highly effective at targeting colon and rectal cancers. It was also used in combination chemotherapy along with methotrexate to treat some cases of breast cancer in women. Fluorouracil (28) will become incorporated into the thymidylate synthase and will proceed normally like uracil (16). With the cysteine residue attacking the C6 position of fluorouracil (28), forming the enolate 29. The enolate 29 will then form a bond with the activated tetrahydrofolate iminium ion 19, giving the methylene bridged product 30. However the ElcB elimination of the linked tetrahydrofolic acid (15) is not possible, because the fluorine on the C5 position of $\mathbf{3 0}$ cannot be eliminated like the hydrogen in the same position of $\mathbf{2 0}$ through deprotonation, stopping the synthesis of 13 and thus disrupting DNA synthesis and inducing apoptosis (Scheme 5).

## Chapter 1 - Cancer Chemotherapy

Scheme 5: Mode of action for 5-fluorouracil (29)
Cytarabine or cytosine arabinosido (31) was original isolated from a Caribbean sea sponge, Cryptotethia crypta in 1951. Since then it has been found to have in vivo antitumour activity against leukaemia and a variety of transplanted rodent tumours as well as an effective agent

31 in the treatment of acute leukaemia in adults. ${ }^{28}$ It is presently used against leukaemia and in combination chemotherapy.

### 1.6.4 Anticancer drugs from Nature

Man's search for a cure to his ailments isn't a new one. As previously mentioned, the Ebers Papyurus, an ancient Egyptian scroll from around 1500 BC details over 700 remedies using animal and plant extracts. ${ }^{6}$ Another ancient source of remedies using animal and plant extracts is Chinese Shennung herbal text from around 200 BC. Medical knowledge like this has been passed down the generations. In the $19^{\text {th }}$ century scientists started to isolate and characterize compounds from these remedies. However many of the compounds proved to be too complex to be characterised until the $20^{\text {th }}$ century. In the late 1940 scientists started a systematic search for novel natural products with interesting biological properties. ${ }^{4}$ These studies have given us several highly active anticancer drugs, such as vinblastine and vincristine.

In the Philippines the extract of the Madagascar periwinkle was used as a treatment of diabetes. The extract was also used in the same way in South Africa. In England the extract was sold as "Vin-q-lin" and was believed to reduce blood sugar. However experiments done by Ralph Noble ${ }^{29}$ at the University of Western Ontario, Canada, on rats showed that the extract did not lower their blood sugar level. All the rats tested died due to infections; more tests showed that the extract lowered the white blood cell count. With the help of an English chemist Charles Beer in 1958 they isolated a pure compound that depleted white blood cells and called it vincaleukoblastine, later known as vinblastine (32). ${ }^{30}$ At the same time Eli Lilly made similar discoveries and had found that the plant extract prolongs the life of mice carrying the leukaemia cell line P1534. They isolated a total of four vinca alkaloids that

## Chapter 1-Cancer Chemotherapy

showed antileukaemia activity. Only Vinblastine (32) and Vincristine (33) went into clinical trials. ${ }^{31}$ Vinblastine is now used in the treatment of Hodgkin's lymphoma, testicular teratoma, and bladder cancer. Vincristine is used in
 the treatment of Hodgkin's lymphoma and a host of rare childhood cancers including Wilm's tumour, neuroblastoma, rhabdomyosarcoma and Ewing's sarcoma. Both compounds have serious adverse effects, Vinblastine leaves people susceptible to infection and depresses bone marrow cell production, while use of Vincristine can cause loss of sensation in fingers and toes, constipation and severe abdominal pain.

Another natural extract that has had anticancer activity was derived from Podophyllum peltatum (Mayapple) (34). The Leech book of Bald, around 950 AD , reports the use of wild chervils in the treatment of tumours, wild chervils are thought to be Myrrhis Odorata which is a source of a podophyllotoxin analogue. The NCI screening of natural compounds showed that podophyllotoxin (34) isolated from the American Mayapple had antitumour

34 activity. However it proved to be too toxic in clinical trials.

Further studies done by the Swiss pharmaceutical company Sandoz, making semisynthetic glycosides analogues of podophyllotoxin, finally yielded two successful drugs Etoposide (35) and Teniposide (36). Etoposide is used as a less toxic replacement for Vinblastine (32) in testicular cancer as well as small cell lung cancer. Teniposide (36) is used to treat acute lymphoblastic leukaemia and rare childhood cancers like neuroblastoma. They work by inhibiting the topoisomerase II enzyme, which is involved in the process of unwinding
 supercoiled DNA. Inhibition of topoisomerase II effects the $S$ phase of the cell cycle and blocks the continuation to the G2/M phase and leads to apoptosis. ${ }^{32}$

The natural product Camptothecin (37) was isolated from Carmptotheca acuminata, a tree native to China and Tibet which is used in traditional Chinese medicine, by Monroe Wall in 1958. ${ }^{33}$ It was found to have potent antitumour activity against leukaemia L1210. The structure of Camptothecin (37) was determined in 1966. ${ }^{34}$ More water soluble analogues Topotecan (38) and Irinotecan (39) are used in the clinic for treatment of colon and ovarian

## Chapter 1 - Cancer Chemotherapy

cancers, respectively. ${ }^{33}$ The mode of action of Camptothecin (37) was found in 1985 , ${ }^{35}$ it inhibits the topoisomerase I enzyme which is needed in the $S$ phase of the cell cycle to cause the DNA to unwind. ${ }^{33}$

Since the discovery of penicillium in mould by Fleming in 1928, ${ }^{36}$ scientists have been studying the biological activities of microorganisms, this has led to hundreds of antibiotics and has also led to several antitumour agents.

In 1960 Faber reported about the antitumour properties of actinomycin $D$ (40) in treating Wilm's tumour in children. ${ }^{37}$ Actinomycin D (40) had been isolated from Streptomyces parvullus by Waksman in his studies of possible new antibiotics in 1954. ${ }^{38}$ The successes of actinomycin D led the way for a new class of anticancer drug into the clinic.

40
Mitomycin C (41) was first isolated from Streptomyces caespitosus 1958 by Wakaki. ${ }^{39}$ It was also isolated from Streptomyces verticillatus and characterized by Lefemine and coworkers. ${ }^{40}$ It proved to be highly toxic against a range of tumour cells as well as normal cells, causing severe side effects including vomiting, bone-marrow depression, alopecia, kidney and liver toxicity and heart damage. However it was widely used in Japan in the 1960s. Mitomycin C is bioreduced in vivo, producing reactive intermediates that are capable of forming covalent bonds to DNA, similar to the alkylating agents. ${ }^{41}$ The quinone of Mitomycin $C$ (41) is reduced to the dihydroquinone 41a. The bioreduction of Mitomycin C 41 , to the dihydroquinone 41a then triggers the loss of methanol (since the nitrogen lone pair is no longer delocalized) to give the conjugated electron rich system of leucoaziridinomitosene (41c). The hydroxy group on the C8 position of 41 b then donates its electron pair causing the aziridine ring to open and give 41d (Scheme 6). The Cl position of 41 d then undergoes nucleophilic attack from DNA to form the first DNA cross linking bond to give the 41 e . Another nucleophilic group within DNA then attacks the C10 position of 41e and eliminates the carbamate group forming the second DNA covalent bond, and giving the alkylated DNA product $\mathbf{4 1 \mathrm { f } ^ { \mathbf { 2 } }}$ (Scheme 6)

## Chapter 1 - Cancer Chemotherapy

## Scheme 6

A more useful class of antitumour antibiotics is the anthracyclines. They were first isolated by the Arcamone group in the early 1960s and were found to strongly to inhibit the growth of a variety of tumours. ${ }^{43}$ Many hundreds of analogues have been made, including Daunorubicin (42) and Doxorubicin (43). Doxorubicin (42) has a broad spectrum of anticancer activity; it is used today for the treatment of solid tumours and childhood leukaemia. Daunorubicin (43) is one of the drugs of choice used against adult leukaemia. The flat aromatic unit of these compounds slide between the DNA bases by intercalation so that the DNA can't separate (Figure 6). They also inhibit the topoisomerases II enzyme. The other mode of action these
 compounds have is that they undergo a chemical reaction to form radicals, the radicals react with DNA and damage $i t$. The main side effect of these drugs is damage to the heart muscle and cardiotoxicity.

## Chapter 1 - Cancer Chemotherapy

Figure 6: X-ray crystal structure of the intercalation of DNA base by Doxorubicin (43) ${ }^{\text {th }}$
Another area of development in anticancer drugs is the use of hormone mimics to treat cancer. In 1896 a Scottish surgeon George Beatson reported in Lancet that tumours of women with breast cancer ceased growing and regressed after the removal of their ovaries and fallopian tubes. ${ }^{45}$ At the time nothing was known about hormones and this was inspired by the idea of the link between the mammary glands and the ovaries, which was shown that when a mother was breast feeding her menstrual cycle stopped. Since then it has been discovered that cell growth and differentiation is controlled by hormone signals, and that by switching off production of hormones or interfering with the receptor-hormone complex provides a means of cancer therapy.

In the 1930s Dodd and coworkers investigated hormone mimics of estrogen. They found that a dimer of p-propenyl phenol (44) had potent oestrogenic activity. This led to a range of dimeric structures being synthesized, in 1938 diethylstilbestrol (45) was reported to be 2-3 times more active than estrone. ${ }^{\text {to }}$ In 1944 Haddow reported that some

46a breast cancer patients could be helped by treating them with diethylstilbestrol (45). Further modification of diethylstilbestrol led to Tamoxifen (46) first made by ICI. This exists as two

## Chapter 1 - Cancer Chemotherapy

isomers, the $Z$-isomer (46a) having potent oestrogenic activity, the $E$-isomer (46) having potent antiestrogenic activity. Tamoxifen (46) acts in estrogen-dependent cancers by binding to the estrogen receptor in a tumour cell, blocking the attachment of oestrogen, thus also preventing the activation of DNA and cell division. First used in clinical trail in 1971, it has proven to the drug of choice with post menopausal patients with breast cancer. Tamoxifen (46) has been reported as leading to a $25 \%$ reduction in the recurrence of tumours after their removal and $17 \%$ reduction in the mortality rate in breast cancer. ${ }^{47}$ Raloxifene (47) was originally used in the treatment of osteoporosis in postmenopausal women, but it was also found to be a potent antiestrogen, preventing rat mammary carcinogensis. ${ }^{48}$ Raloxifene (47) can be used if a woman with breast cancer becomes resistant to Tamoxifen (46). ${ }^{49}$ Raloxifene (47) also binds in the estrogen receptor in cells (Figure 7).

Figure 7: X-ray crystal structure of Raloxifene (47) binding in the Estrogen receptor ${ }^{50}$
The early discoveries in the field of chemotherapy were all unselective cytotoxic agents, many of which are still used today. However as our knowledge of cancer increases, modern chemotherapy is becoming more selective, with new anticancer agents seeking to target specific biological models to prevent oncogenesis.

In May 2001, Gleevec (48) was the first "target-based" cancer therapy to be approved by the FDA for the treatment of chronic myelogenous leukaemia (CML) ${ }^{51}$ CML is associated with a specific chromosomal translocation, known as Philadelphia chromosome which is detected in $95 \%$ of patients with CML. ${ }^{32}$ The result of this translocation is the creation of the BCRABL fusion protein, which is an activated form of tyrosine protein kinase. ${ }^{51 / 53}$ The oncogenic properties of the BCR-ABL fusion protein were further demonstrated by several studies done

## Chapter 1 - Cancer Chemotherapy

in mice, where the introduction of the BCR-ABL fusion protein to healthy mice would induce chronic myelogenous leukaemias. ${ }^{5456}$ Therefore the inhibition of BCRABL tyrosine kinase activity in CML cells became an attractive drug target for the treatment of the disease. ${ }^{51}$

49

Extensive optimization of phenylamino-pyrimidines (49) by Zimmermann ${ }^{57}$ et al. yielded a highly potent $\left(\mathrm{IC}_{50}=38 \mathrm{nM}\right)$ and selective inhibitor of BCR-ABL kinase, Gleevec (48). ${ }^{57}$ Xray crystallography shows that $\mathbf{4 8}$ inhibits the BCR-ABL kinase activity, by binding with high specificity to the inactive form of the ABL kinase (Figure 8) ${ }^{58}$

Treatment with Gleevec (48) results in remission in nearly $100 \%$ of newly diagnosed patients in the early stages of CML. ${ }^{59}$ The side effects from the use of Gleevec have mainly been mild with adverse effects such as nausea, vomiting, oedema and muscle cramps being mostly reported, however on rarer occasions liver toxicity or fluid retention have also been reported. ${ }^{51}$ Even with these rarer serious side effects, treatment with Gleevec is far less toxic than the treatment of a more traditional chemotherapy.

Figure 8: X-ray crystal structure of Gleevec (48) binding to inactive form of the ABL kinase. ${ }^{58}$

## Chapter 2 - Development of agents that target Tubulin

### 2.1 Developing Antimitotic Agents

Cancer chemotherapy agents are being designed to exploit the differences between normal and malignant cells. The ultimate goal is a drug that will only target cancer cells and destroy or render them benign, and not affect normal cells. The increased cell growth and division of cancer cells presents an attractive and achievable target for drug design by making them more selective to rapidly dividing cells. The biochemical target we are interested in is tubulin and the formation of microtubules, which plays a vital role in cell divison. The disruption of microtubule formation will impede the replication of the dividing cancer cells and will lead to cell death.

### 2.2 The Cell Cycle and Mitosis

Cell division is arguably one of the most complex and demanding process undertaken by the body. During this process the DNA of the cell will become unraveled and duplicated. The cell will then reorder the DNA strands into 2 new identical sets of chromosomes. The 2 new duplicate sets of DNA will be moved to opposite sides of the cell to make new nuclei, which will eventually separate into 2 new daughter cells.

Figure 9: The Cell Cycle
The cell cycle is split into 5 different phases (Figure 9). The first is the $\mathrm{G}_{1}$ phase or intermitotic phase where the cell checks the DNA integrity, cell size, presence of nutrients and growth factors in preparation of cell division. This is followed by the $S$ phase or DNA synthesis phase where replication of the DNA and chromosomes takes place. The cell cycle

## Chapter 2 - Development of agents that target Tubulin

then enters the $G_{2}$ phase or premitotic phase, where the integrity of new DNA is checked. These 3 stages are known as the interphase and it accounts for $95 \%$ of the time taken for a cell to divide. The M phase or mitosis stage is then entered, during which the chromosomes are segregated and the cell divides, this stage takes about an hour to complete. The fifth phase of the cell cycle can take place during the $G_{1}$ phase if there is a lack of sufficent stimuli, it can become indefinite and the cells will become quiescent, this is known as the $\mathrm{G}_{0}$ phase. ${ }^{60.61}$

## Microtubules.

Anaphase.

Telophase.

Figure 10: Stages of Mitosis ${ }^{62}$
The Mitosis phase is split into 5 separate stages (Figure 10). Starting with the prophase where the microtubules start to form and grow towards the 2 sets of daughter chromosomes. The microtubules grow from the centrozomes which separate and move to opposite ends of the cell. The next phase is the prometaphase where the nuclear envelope around the nucleus disintegrates and the microtubules attach themselves to the centre point of the chromosomes known as the Kinetichore. The chromosomes gradually arrange themselves between the 2 centrozomes. This is the metaphase. Once the chromosomes are accurately arranged between the 2 centrozomes, the cell abruptly enters the anaphase. The daughter chromosomes begin to separate and move towards the centrozomes as the microtubules

## Chapter 2 - Development of agents that target Tubulin

attached to them begin to decay. Once the chromosomes reach other ends of the molecule a new nuclear envelope is formed around them. This is the end of mitosis with only the surrounding cytoplasm needing to divide in the process know as cytokinesis, giving 2 identical daughter cells. ${ }^{62}$

### 2.3 The formation of Microtubules from Tubulin ${ }^{62}$

As mentioned above microtubules play a vital role in cell divison and disruption of the microtubules can have a major effect on the cell. Tubulin exists as 2 spherical proteins, the $\alpha$ and $\beta$ tubulin subunits, each with a molecular weight $\sim 50 \mathrm{kDa}$. The 2 subunits come together to make a heterodimer. In the presence of GTP and $37^{\circ} \mathrm{C}$, the heterodimers combine in a head to tail fashion to form protofilaments comprised of a long line of alternating $\alpha$ and $\beta$ tubulin subunits. After several minutes of protofilament formation, 12 to 13 protofilaments will come together and form a protein sheet, that curls up into a C -shape to give the pipe-like structure of the microtubule. The external diametre of the microtubule is $\sim 24 \mathrm{~nm}$ and the internal diamter is $\sim 15 \mathrm{~nm}$ across (Figure 11). There are several types of proteins that are associated with the microtubules and their formation, which are known as microtubule associated proteins (MAPs). The presence of the MAPs increases the speed of microtubule formation and protect it from depolymerization agents like low temperature and $\mathrm{Ca}^{2+}$ ions. There are also the microtubules organising centres (MTOCs) or centrozomes, where the microtubule starts its growth. The $3^{\text {rd }}$ type of protein involved in formation of microtubules is $\boldsymbol{\gamma}$-tubulin, which may bind to the centrozome, from there it may act as a site for nucleation for incoming $\alpha, \beta$-tubulin heterodimers.

Once formed the microtubule maintains it shape by remaining in a dynamic equilibrium where heterodimers constantly add to one end of the microtubule (+ end) and leave from the other end of the microtubule (- end). This is a finely balanced equlibrium which controls the length and function of the microtubule. Disruption of this equlibrium will affect a number of cell functions including cellular divison.

## Chapter 2 - Development of agents that target Tubulin

Figure 11: Polymization of Tubulin to Microtubules ${ }^{63}$

### 2.4 The Role and Dynamic Instability of Microtubules

As well as being vital to mitosis, microtubules are also key components of the cytoskeleton and are critical in the development of and maintenance of cell shape. They are also involved with the transport of vesicles, mitochondria and other components though out the cells, needed for cell signaling and mitosis. ${ }^{63}$ One of the most remarkable features of microtubules is its dynamic instability, with it constantly growing or shrinking depending on the needs of the cell. The half life of a microtubule can range from several hours in the interphase when the cell is preparing itself for replication of the DNA, to tens of seconds in the metaphase where the new strands of DNA are separated and moved to other ends of the cell so it can divide. ${ }^{61}$ If the equilibrium of formation of microtubules from tubulin can be disrupted by using an agent that will inhibit the decay of microtubles or the binding of tubulin to form microtubules, then the separation of chromosomes can be prevented and cell divison stopped. This makes microtubules and tubulin an interesting biological target.

### 2.5 Classes of Mitotic Spindle Poison ${ }^{61-63}$

Tubulin is the target of several drugs used clinically in the treatment of cancer. These drugs can be classified by which site they bind to on Tubulin. These sites include the Colchine binding site, the Vinca Alkaloid binding site, the Rhizoxin/Maytansine binding site and the Taxane binding site. However some agents do not bind to any of these sites and instead have an affinity for reactive groups on tubulin like cysteine sulfhydryl groups.

## Chapter 2 - Development of agents that target Tubulin

### 2.5.1 The Colchicine Binding Site

Colchicine (50) is considered to be the classic tubulin binding agent. ${ }^{64}$ It was first isolated from the meadow saffron Colchicum autumnale and is a highly soluble alkaloid ${ }^{65}$ which is currently used as an effective treatment for gout. However it has proven to be too toxic to use in other therapies. It binds to a high affinity site on the tubulin
 heterodimer which causes a structural change and the partial unfolding of structure of $\beta$ tubulin. It is this change that disrupts the region needed for microtubule formation. ${ }^{66}$ Ravelli and coworkers have recently reported the structure of tubulin-colchicine complex, identifying the colchicine binding site on the $\beta$-tubulin subunit. ${ }^{67}$ The colchicine (50) binds at a location which curves the tubulin and prevents it adopting a straight structure, which is needed for the formation of microtubules (Figure 12). ${ }^{67}$

Figure 12: X-ray crystal structure of colchicine binding site to the $\beta$-tubulin subunit. ${ }^{67}$
Structural related analogues of Colchicine (50) that retain their binding affinity to the colchicine site of tubulin include 2-methoxy-5-( $2^{\prime}, 3^{\prime}, 4^{\prime}$-trimethoxyphenyl)tropone (51), which prevented microtubule assembly at concentrations comparable to Colchicine (50) itself. However the analogue that has no methoxy groups on the B ring $(\mathbf{5 2})$ is almost inactive. ${ }^{68}$

52

## Chapter 2 - Development of agents that target Tubulin

Centauriedin (53) a natural flavone isolated from Polymnia fruticosa, prevents the binding of Colchicine (50) to tubulin and the formation of microtubules. ${ }^{69}$ Since the discovery that centauriedin (53) causes mitotic arrest by destabilizing the mitotic spindle, other flavones have shown tubulin inhibiting properties such as the flavone (54) isolated from both Zieridium pseudobtusifolium and Polansia dodecandra. ${ }^{70.71}$

Chalcones. A series of chalcones, typified by 55 were synthesized by Edwards and co-workers and were shown to be potent cytotoxic agents. ${ }^{12}$ Lawrence and co-workers revealed 56 as a potent anticancer agent ${ }^{73}$ with many other chalcones displaying high levels of cytotoxicity. Lawrence and co-workers have also used parallel synthesis to produced a library of over 600 chalcones, yielding 16 positive hits from their bioassay screening of the library, with the most active being chalcone 57. ${ }^{74}$ Such agents induce mitotic arrest, strongly binding to tubulin and preventing microtubule assembly. This will be discussed in more detail in chapter 3, since this forms the basis of the work described in this dissertation.

Combretastatins. The stilbene Combretastatin A-4 (58) is one of the most potent inhibitors of the colchicine binding site. ${ }^{5}$ It was first isolated from the South African Willow, Combretum caffrum, along with the less active Combretastatin 59 and Combretastatin A-2 (60). ${ }^{76}$ These compounds are some of the simplest structures that show antimitotic effects by interaction with the colchicine binding site of tubulin. Combretastatin A-4 (58) has also generated lots of interest due to its effects on the inhibition of angiogenesis, the growth and development of blood vessels ${ }^{77}$

57

 as well as its antimitotic effects. ${ }^{78}$

Due to the biological effects of the Combretastatin A-4 (58) there have been many structureactivity relationship (SAR) studies reported in recent years to try and maximize their biological properties. It has been generally accepted that A-ring of 58 must be kept as 3,4,5-

## Chapter 2 - Development of agents that target Tubulin

trimethoxyphenyl for compound to maintain its potent antimitotic effects. ${ }^{79}$ However recent work reported

616263
X F Cl Br

$\begin{array}{llll}64 & 65 & 66 & 67 \\ 68\end{array}$
X $\mathrm{N}_{3} \mathrm{NH}_{2} \mathrm{~F} \quad \mathrm{Br} \mathrm{NO}_{2}$

6970 X N CH by Pettit ${ }^{80}$ has shown that the methoxy group on the C 3 position of the A-ring can be replaced with a fluorine group in 61, chlorine group in 62 or bromine group in 63 and still retain the antimitotic effects of 58 . The hydroxy group on C 3 position of the B-ring of $\mathbf{5 8}$ can be replaced by several different groups including azido group in $64,{ }^{81}$ amine groups in $65,{ }^{79.81,82}$ fluorine groups in $66,{ }^{83}$ and still maintain high levels of cytotoxicity comparable to 58 . The hydroxy group on C 3 position can also be replaced by bromine groups in $67,{ }^{84}$ and nitro groups in $68^{84}$ or the whole $B$ ring can be replaced with quinoline groups in $69^{85}$ or a napthalene group in $70^{8.87}$ and still retain good high levels of cytotoxicity, but not as high as 58.

The SAR studies have also involved modification of the group that links the A and B rings. The cis-ethene linker has been replaced with an ethane linker in 71, ${ }^{88}$ and had an additional double bond in $72^{89}$ or triple bond in $73^{90}$ unit introduced to the linker as well. These changes to the linkers have all resulted in a general loss of cytotoxicty.

71

72

The introduction of various alkyl groups in 74 - 75, ${ }^{91}$ acylamide groups in 76-7792 and other bulky groups ${ }^{79.91 .92}$ attached to the ethene linker also gives CA4 analogues with reduced cytotoxicity. The nitrile group in $\mathbf{7 8}^{79}$ appears to be largest group tolerated on the ethene cross linker with out causing a large loss cytotoxicity.

Various cis-locked analogues of $\mathbf{5 8}$ have also been investigated, replacing the cis-ethene linker with either an 1,2 ,-disubstituted five membered heterocycle such as imidazole 79 or oxazole 80 gave several compounds which inhibited tubulin polymerization more potently than 58 while still being less cytotoxic. ${ }^{93}$ The replacement of the cis-ethene linker with a furazan ring gave a compound $811^{94}$ that was 4 times more cytotoxic than Combretastatin A-4 (58) and inhibited tubulin polymerization.

## Chapter 2 - Development of agents that target Tubulin

Clinical trials of Combretastatin A-4 (58) have been hindered by its low water solubility, prompting research into Combretastatin analogues with enhanced solubility. Ohsumi and coworkers synthesized a more water soluble analogue of Combretastatin A-4 (58) in which the phenol group of the B ring was replaced with an amino group, (AC-7739, 82). ${ }^{79}$ This analogue proved to have a more potent antitubulin activity than its parent molecule. Cushman and co-workers made a series of benzylamines hydrochlorides typified by 83, these compounds displayed good water solubility and bind to tubulin in a similar

 manner to Combretastatin A-4 (58). ${ }^{\text {s }}$

Other recent areas of Combretastatin research is the development of a chimeric compound 84 bearing the Combretastatin and nitrogen mustard core to see if this combination could over come multidrug resistance (MDR) protein induced by various alkylating agents. The chimeric compound 84 which is a cross between Chlorambucil (4) and Combretastatin A-4 (58) is reported to inhibit tubulin polymerization concentrations as low as would be expected for 58. At higher concentrations the nitrogen mustard alkylates tubulin and inhibit tubulin depolymerization much like Paclitaxel (85). ${ }^{95}$

Benzophenones. The benzophenone analogue of Combretastatin A-4 (58), Phenstatin (86) was isolated as a side product from the Jacobsen oxidation of 58. ${ }^{\%}$ Phenstatin (86) proved to be a potent inhibitor of tubulin polymerization, comparable to Combretastatin A-4 (58). ${ }^{6}$ It is also highly cytotoxicity, but not as cytotoxic as $58 .{ }^{97}$ Several SAR studies ${ }^{96-99}$ have been carried out on the benzophenone scaffold, trying to improve the biological activity of the Combretastatin A-4 like benzophenone. Many of the compounds made have inhibition of

## Chapter 2 - Development of agents that target Tubulin

tubulin polymerization activity comparable to $\mathbf{5 8}$, many of them weren't as cytotoxic as 58. However the 2-aminobenzophenones 87 and $\mathbf{8 8}$ proved to be as cytotoxic as Combretastatin A-4 (58). ${ }^{97}$

86

87

88

Further investigation showed that the 2-amino-4-methoxyphenyl ring of benzophenone analogue 87, can be replaced 3-amino-6-methylbenzo[b]thiophene to give 89 which proved to
be more active than 58 as an inhibitor of tubulin polymerization, however it wasn't as cytotoxic. ${ }^{100}$ The B ring of phenstatin (86) has also been replaced by various heterocycles

89
like 3-aroylindoles $90,{ }^{101}$ benzo[b]thiophenes 91, ${ }^{102-104}$ benzo[b]furans $92^{104}$ or indoles $93,{ }^{104}$ many of which proved to be more potent inhibitors of tubulin polymerization than Combretastatin A-4 (58), however none of

 them are as cytotoxic as 58. The replacement of the carbonyl linker group between the 2 aryl rings with a methylene group led to a complete lose of biological activity. ${ }^{99,104}$ The presence of 3,4,5-trimethoxyphenyl ring has also proved to be vital for biological activity. ${ }^{100}$

Cornigerine (94) a natural product isolated from Colchicum cornigerum, resembles a hybrid of Colchicine (50), podophyllotoxin (34) and steganacin (95). As would be expected from the similarity of its structure, 62 displays a similar effect binding to the colchicine site with high affinity. ${ }^{\text {Ios }}$

Steganacin ${ }^{76}$ (95) was isolated in $19733^{106.107}$ from the stems and stem bark of the east African tree steganataenia araliacea Hochest, and was found to have in vivo antitumour activity against P388 leukaemia in mice and in vitro against human nasopharynx carcinoma cell line KB. ${ }^{106}$ Steganacin (95) completely inhibits cleavage in fertilized sea urchin eggs at
 concentration of $0.3 \mu \mathrm{M}$ by preventing the formation of mitotic apparatus. ${ }^{108}$ Steganacin (95) shares structurally features with both Colchicine (50) and

## Chapter 2 - Development of agents that target Tubulin

Podophyllotoxin (34), with all 3 compounds sharing a trimethoxybenzene ring. Like Podophyllotoxin ${ }^{109}$ (34), Steganacin (95) binds to tubulin with an affinity similar to Colchicine (50), and is, in fact, a competitive inhibitor of colchicine binding to tubulin. ${ }^{108.110-113}$ Steganacin (95) has also been shown to inhibit in vitro polymerization of microtubules, ${ }^{108,110,111}$ with an $\mathrm{IC}_{50}$ value of $1.5-3.5 \mu \mathrm{M},{ }^{110.111}$ which makes it slightly less active than both Colchicine [50, $\mathrm{IC}_{50}$ (polymerization of microtubules) $\left.2.5 \mu \mathrm{M}\right]^{111}$ and Podophyllotoxin [34, $\mathrm{IC}_{50}$ (polymerization of microtubules) $\left.0.6-1.7 \mu \mathrm{M}\right]^{110.111}$

Podophyllotoxin (34), Etoposide (35) and Teniposide (36). Podophyllotoxin (34) is isolated from the dried roots of the American mandrake Podophyllum peltatum. It has been used as a medical treatment for hundreds of years for conditions ranging from sclerosis of the liver through to constipation, rheumatism and cancer. Podophyllotoxin (34) has been shown to bind reversibly to at least part of the colchicine site of tubulin and binds as a competitive inhibitor. ${ }^{109}$ However Podophyllotoxin (34) proved to be too toxic for clinical use in the treatment of cancer, so two less toxic semisynthetic analogues have been developed Etoposide (35) and Teniposide (36). ${ }^{114}$ Although both compounds bind to tubulin, it is thought now that they function predominantly by inhibition of DNA topoisomerases II, an enzyme involved in the unfolding of DNA in cell replication, rather than a microtubule interaction. ${ }^{115}$

34

36 Teniposide

### 2.5.2 Vinca Alkaloid Binding Site.

The two vinca alkaloids Vinblastine (32) and Vincristine (33) were isolated from the Catharanthus roseus periwinkle. They are both used as clinical anticancer drugs for the treatment of leukaemias, lymphomas and some solid tumours. ${ }^{116}$ Both these agents bind to a site on the $\beta$-tubulin subunit of the heterodimer ${ }^{117}$

## Chapter 2 - Development of agents that target Tubulin

with a high affinity for the protein ${ }^{118}$ and induce destabilization of polymerized tubulin. The destabilizing effect results from the stoichiometric endwise poisoning of the tubulin heterodimer, presumably preventing polymerization from occurring by blocking the region involved in heterodimer attachment. Due to the dynamic nature of microtubules constantly polymerizing and depolymerizing, a vinca alkaloid poisoned heterodimer can be easily introduced to the microtubule, thus preventing further growth. The incorporation of the vinca alkaloid onto the heterodimer is rapidly reversible and occurs at 2 sites per tubulin dimer. As well as the two natural products 32 and 33, a third effective alkaloid has also been produced by functional group transformation, Vindesine (96) and works by the same mechanism. Other Vinca Alkaloid binding site agents include halichondrin B (97), the hemiasterlins ${ }^{119}$ and the spongistatins, ${ }^{120}$ all isolated from various marine sponges. Halichondrin $B(97)$ has been isolated from several sponges Halichondria okadai, ${ }^{121}$ Axinella sp, ${ }^{122}$ Phankellia carteri ${ }^{123}$ and Lissodendoryx sp, ${ }^{124}$ and have potent in vitro and in vivo activities against melanomas and leukaemias. ${ }^{125}$ Halichondrin B (97) is extremely rare in the marine sponges, with only 12.5 mg of 97 being isolated from 600 kg of Halichondria okadai, ${ }^{121}$ and would have limited the study of 97 as a viable tubulin targeting agent. Fortunately the complete synthesis of 97 was reported by Aicher and coworkers ${ }^{126}$ and further research into the structure has led to the structurally simpler analogs, ER-076349 (98) and ER-086526 (99) which still retain the biological activity of $97 .{ }^{125}$ The hemiasterlins are a family of cytotoxic and antimitotic tripeptides that have all been isolated from various marine sponges, such as Avletta $s p$ [hemiasterlin (100), hemiasterlin A (101) and hemiasterlin C (102)] ${ }^{127}$ and Cymbastela $s p$ [hemiasterlin $\mathrm{A}(\mathbf{1 0 1 )}$ ) and hemiasterlin $\mathrm{B}(103)] .{ }^{128}$ Despite their relatively simple structures the hemiasterlins $A$ and $B$ (101 and 103) are more potent in both cytotoxic and antimitotic activity than other microtubule agents such as Vinblastine (32) and Paclitaxel (85). ${ }^{119}$ Spongistatins 1-9 ${ }^{129}$ are a group of macrocyclic lactones compounds ${ }^{130}$ which have been isolated from various marine sponges, Spongistatin 1 (104) was isolated from the Republic of Maldives Spongia sp. ${ }^{131}$ The Spongistatins have all proven to be highly cytoxic, with Spongistatins 1 (104) having an $\mathrm{IC}_{50}$ value of 0.03 nM for the inhibition of L 1210 murine leukaemia cells. ${ }^{129}$

## Chapter 2 - Development of agents that target Tubulin

### 2.5.3 Rhizoxin/Maytansine (RZX/MAY) Binding Site.

Rhizoxin (105) was isolated from the fungus Rhizopus chinensis and is an antifungal agent which also acts as an antimitotic agent. Like many of the agents that bind to the RZX/MAY binding site, 105 was originally thought to be binding to the Vinca alkaloid binding site. However Rhizoxin (105) has been shown to have its own binding site that slightly overlaps with the Vinca alkaloid binding

105 site. ${ }^{132}$ Rhizoxin (105) is effective against hundreds of cancer cell lines and some vinca alkaloid resistance tumours, it also competively inhibits Maytansine (106) binding and exhibits similar effects. ${ }^{62}$ Maytansine (106) is isolated from various plants in the Maytenus family. It is the most potent of a family of highly cytotoxic macrolides. ${ }^{133}$ Maytansine (106) binds to tubulin and in a

106 reversible manner and can competitively inhibit the vinca alkaloids 32 and $33 .{ }^{134}$ Maytansine

## Chapter 2 - Development of agents that target Tubulin

(106) binding to tubulin causes disassembly of the microtubules and prevents tubulin spiralization. ${ }^{135}$ Other RZX/MAY binding site agents include Cryptophycin $1,{ }^{136}$ the Dolastatins ${ }^{137}$ and Phomopsin A. ${ }^{138}$

### 2.5.4 Taxane Binding Site.

Paclitaxel (Taxol ${ }^{\text {TM }}$ ) (85) first isolated by Monroe Wall and Mansukh Wani in 1967 from the bark of a yew tree. ${ }^{139}$ It was largely ignored as antimitotic agent, due to low availability and poor water solubility, until 1979 when the discovery that it stimulated microtubule polymerization, unlike the Vinca alkaloids which induce destabilization of polymerized tubulin. ${ }^{140}$ Four groups have succeeded in the total synthesis ${ }^{141 / 145}$ of Paclitaxel (85), and it is now used to treat breast and ovarian cancer as well as non-small-cell lung cancer and Kaposi's sarcoma. ${ }^{63}$ The binding site of Paclitaxel (85) is on the $\beta$-subunit of tubulin and is on the inside of the surface of the microtubule, ${ }^{1+6}$ and this binding stabilizes the microtubule and increases its polymerization. Taxotere (107) is a late stage intermediate in a synthesis of Paclitaxel (85) from a precursor readily obtained from needles from a yew tree. It displays a similar spectrum of activity as $\mathbf{8 5}$ but with a four fold increase in potency and improved water solubility. ${ }^{147}$ It is currently used in clinical treatments of prostate, brain and lung tumours. ${ }^{63}$

Discodermolide (108) is a potent immunosuppressive lactone isolated from Caribbean Sea sponge Discodermia dissolute. It also inhibits the dynamic nature of microtubules by binding to the microtubule and making it abnormally stable. Studies show that $\mathbf{1 0 8}$ shares the same binding site as Paclitaxel (85), has a greater affinity for this site. ${ }^{148,149}$ Discodermolide (108) is currently in phase I clinical trials. ${ }^{63}$ The Epothilones (e.g. 109 and 110) a family of 16 membered macrolides isolated from the myxobacterium Sorangium cellulosum. Like Discodermolide (108) they are competitive inhibitors of the binding of Paclitaxel (85) to tubulin, exhibiting activity similar to $\mathbf{8 5}$ at the same concentrations. ${ }^{150}$ It is thought that Paclitaxel (85) and the Epothilones may share a common pharmacophore and adopt similar conformations in vivo. ${ }^{151}$ The Epothilones are currently used clinically in the treatment of Paclitaxel-resistant tumours. ${ }^{63}$

## Chapter 2 - Development of agents that target Tubulin

### 2.6 Antivascular effect ${ }^{152.153}$

The tumour vasculature network is an important cancer therapy target. By disrupting the tumour vasculatures, the vital supply of oxygen and nutrients in blood that feeds the tumour will be cut off causing most tumours to starve and die. Antivascular agents inhibit tumour vascular function in 2 different ways; some inhibit the formation of new blood vessels, angiogenesis, ${ }^{1.4}$ to tumours, while other compounds, especially tubulin targeting agents, have been shown to rapidly shut down existing tumour vasculatures. ${ }^{152}$ Several Colchicine binding site agents are currently in clinical trials, including Combretastatin A-4 3-O-phosphate (CA-4-P) (111), Combretastatin A-1-phosphate (CA-1-P) (112), ZD6126 (113) and AVE8062A (114). ${ }^{152}$ Certain dolastatins like TZT-1027 are also in clinical trials for their antivascular effect, but target the vinca alkaloid binding site instead. ${ }^{63,15 s}$

Combretastatin A-4 3-O-phosphate (CA-4-P) (111) has been shown to cause microtubules in endothelial cells to undergo rapidly depolymerization in a matter of minutes, which causes the cells to become round and the vasculature to become leaky, also known as blebbing. This eventually leads to secondary tumour cell death. ${ }^{156}$ In vivo testing on P22 tumour in rats with CA-4-P (111) showed that the blood flow rate to the interior of the P22 tumour dropped to $<5 \%$ of the starting value within a minute after the administration of 111 , and this value fell to almost zero after an hour. ${ }^{157}$

Also importantly further in vivo studies on P22 tumour in rats with 111 showed that its antivascular effects are selective against tumour vasculature without causing significant harm to normal tissue. ${ }^{158}$ The reason for the selective nature is not known, however it has been suggested that it may be due to the difference between mature normal vasculature and immature tumour vasculature. Normal vasculature can sustain more endothelial cell injury without the

$112 \mathrm{R}=\mathrm{COCHNH} \mathrm{CH}_{2} \mathrm{OH}$

## Chapter 2 - Development of agents that target Tubulin

vascular collapse than the less developed cytoskeleton of the tumour vasculature. ${ }^{157}$ The selectivity could also be due to the difference in blood flow rate of tumours and normal tissue, with tumour blood flow rate being far more slow than that of normal tissue, making the tumour more susceptible to CA-4-P (111). ${ }^{157}$ Also differences in tumour and normal tissue endothelial cells, like proliferation rate, ${ }^{78}$ post-translational modifications of tubulin and the interaction of actin cytoskeleton and tubulin might also contribute to the specificity of vascular-targeting agents like CA-4-P (110). ${ }^{157}$

Many of the classic mitotic spindle poisons, such as Colchicine (50), Vincristine (33) and Vinblastine (34) induce similar deleterious effects on endothelial cells in culture and damage tumour vasculature in animals at high concentrations. However it has been shown that these new vascular targeting agents are effective at much lower concentrations, for instance $10 \%$ of its maximum tolerated dose of CA-4-P (111) has be shown to shut down tumour blood flow rate after 24 hours. ${ }^{152}$ However at even lower concentrations $1-3 \%$ of the maximum tolerated dose, similar reductions in tumour blood flow did occur but after 24 hours the blood flow rate had recovered, showing that the antivascular effects of the CA-4-P (111) are reversible at to low a concentration. The desired affects of microtubule targeting agents as either antiproliferative agents or as a vascular targeting agent may depend on its pharmacodynamics and pharmacokinetic characteristics, like the reversibility of the tubulin binding and its retention time in cells. Agents that can rapidly bind to tubulin/microtubules and cause microtubules to depolymerize and are rapidly metabolized by the body may act best as antivascular agents. While those agents are retained in cells and induce long term mitotic block might work best as antiproliferative agents causing apoptosis. ${ }^{63}$

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

### 3.1 History and development of the chalcone project. ${ }^{159}$

In 1994 our group launched a plant screening program ${ }^{100-162}$ to investigate the cell growth inhibitory properties of plant extracts from plants used in traditional Chinese medicine. The dried whole plant of Scutellaria barbata D. Don (Labiatae) (Figure 13) is used in traditional Chinese Medicine as an anti-inflammatory, anti-tumour agent and as a diuretic. ${ }^{163}$ It is used clinically to treat cancers of the digestive system, lung, breast, liver. ${ }^{163}$ Clinical studies have shown that $62 \%$ of patients suffering with primary liver cancer hepatoma were totally cured when treated with S. barbata. ${ }^{163}$ The book Anticancer Medicinal Herbs details the use of Scutellaria barbata in several different anti-cancer herbal therapies, for instance the ingredients for the treatment of ovarian cancer consists of Scutellaria barbata ( 50 g ), Solani nigri $(30 \mathrm{~g})$, Solani lyrati $(30 \mathrm{~g})$, Oldenlandia diffusa $(30 \mathrm{~g})$ and Carapax trionycis $(30 \mathrm{~g}){ }^{164}$

Figure 13: Scutellaria barbata

The herb is known to contain several alkaloids and flavones, however the active anti-tumour ingredients of Scutellaria barbata were unknown. Bioassay guided fractionation of the methanol extract of Scutellaria barbata, using the MTT assay ${ }^{165}$ to determine the cytotoxicity of each fraction against the K 562 human leukaemia cell line, led to the discovery of a fraction which had an $\mathrm{IC}_{50}(\mathrm{~K} 562)$ of $7.5 \mu \mathrm{~g} / \mathrm{mL} .{ }^{161}$ Further chromatography of the active fraction showed that the major component of this fraction was the $\alpha, \beta$-unsaturated ketone $E-1-\left(4^{\prime}-\right.$ hydroxyphenyl)-but-1-en-3-one (113) which displayed weak cell growth inhibitory properties, $\mathrm{IC}_{50}(\mathrm{~K} 562) 60 \mu \mathrm{M}$.

113

$$
\mathrm{IC}_{50}(\mathrm{~K} 562) 60 \mu \mathrm{M}
$$

$\mathrm{IC}_{50}(\mathrm{~K} 562) 1.9 \mu \mathrm{M}$

115
IC $_{50}(\mathrm{~K} 562) 2.6 \mu \mathrm{M}$

A library of over 30 trans-phenylbutenones was then prepared and screened for its cell growth inhibitory properties. ${ }^{166}$ It was found that the butenones processing electron withdrawing groups were the most active. For instance the pentafluorophenylbutenone 114

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion was over 30 times more active than 113 and the nitrophenylbutenone 115 was over 20 times more active than 113.

Such findings prompted the investigation of replacing the methyl group of the transphenylbutenone with substituted aryl groups to make chalcones to see what effect this substitution had on its anti-cancer properties. The chalcone scaffold, 1,3-diarylprop-2-en-1one, is commonly found throughout the plant kingdom. Chalcones have been shown to elicit various biological effects including antifungal, ${ }^{167.168}$ anti-inflammatory, ${ }^{169.170}$ anti-bacterial, ${ }^{169.171}$ antimalarial, ${ }^{172.173}$ and anti-mutagenic ${ }^{174.175}$ properties. It was Edwards et al. ${ }^{72}$ who reported the anticancer activity of chalcones, with the

$\mathrm{IC}_{50}$ (HeLa) 12 nM chalcone MDL 27048 (55) being a very potent antimitotic agent.

Various substituted chalcones $116-127^{73.176 .177}$ were then prepared to further investigate the prerequisites needed for high cytotoxicity. The chalcones were prepared through the base catalysed Claisen-Schmidt aldol condensation ${ }^{178}$ of substituted benzaldehydes and substituted acetophencnes. It became apparent that the aryl ring substitution was again an important factor, as the anticancer activity of the chalcone may be improved or diminished depending on the arrangements selected (see table 1).

116-127
Table 1: Cell growth inhibitory properties of substituted chalcones 116 - 127

| Chalcone | $\mathrm{Ar}^{\mathrm{l}}$ | $\mathrm{Ar}^{2}$ | $\mathrm{IC}_{50}(\mathrm{~K} 562) \mu \mathrm{M}$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{1 1 6}$ | 3,4,5-Trimethoxyphenyl | 3,4-Dimethoxyphenyl | 0.3 |

| $\mathbf{1 2 7}$ | 2,5-Dimethylfuran-3-yl | 3,4,5-Trimethoxyphenyl | 2.8 |

The Combretastatin A-4 (58) chalcone analog 117 was the most potent cell growth inhibitor prepared, with a cytotoxicity in the nanomolar region (117, IC $\mathrm{C}_{50} 4.3 \mathrm{nM}$ ). The introduction of

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion the 3-hydroxy substitution on the B-ring greatly increases the cytotoxicity of chalcone 117 , the chalcone 118 without the 3-hydroxy substitution is nearly 70 times less active than 117. The presence the 3,4,5-trimethoxyphenyl A-ring of chalcone 117 also appears vital to the cytotoxicity, which is shown when compared to the 3,4-dimethoxyphenyl analogue 124 which is nearly a 140 times less active than 117 .

The ease of the synthesis of chalcones provided an opportunity to make a large number of analogues. The Claisen-Schmidt condensation ${ }^{178}$ method is attractive because it predominantly generates the $E$-isomer, normally in high yields, from substituted benzaldehydes and acetophenones, a large number of both are commercially available and inexpensive. A 644-membered library of chalcones was prepared by parallel synthesis using the Claisen-Schmidt condensation ${ }^{178}$ of 23 substituted acetophenones and 28 substituted benzaldehydes all commercial available and selected randomly in a conventional 96 -well tissue culture test-plate. ${ }^{74}$ The cytotoxicity of these chalcones was conveniently determined upon the crude products directly in the 96 -well tissue culture test-plate, at a concentration of $5 \mu \mathrm{M}$, by conventional MTT assay ${ }^{165}$ Sixteen wells gave a positive bioassay response; a "success" rate $2.5 \%$. The 16 chalcones were then prepared conventionally on a 10 mmol scale, and the chalcones were indeed all active with an $\mathrm{IC}_{50}(\mathrm{~K} 562)$ less than $5 \mu \mathrm{M}$. Seven of these chalcones had an $\mathrm{IC}_{50}(\mathrm{~K} 562)$ less than $1 \mu \mathrm{M}$, with chalcones 57 and 128 being the most active. Chalcone 57 was also reported to cause cell cycle arrest at the $\mathrm{G}_{2} / \mathrm{M}$ point and binds to the colchicine binding site of tubulin, further testing shows that the chalcone inhibits the polymerization of tubulin with an $\mathrm{IC}_{50}$ value of $1.5 \mu \mathrm{M}$ which is comparable to Combretastatin A-4 (58, reported $\mathrm{IC}_{50}$ for the inhibition of tubulin polymerization varies between $0.5^{179}-2^{180} \mu \mathrm{M}$ ).

Attention was then moved onto the effects of modifying the "bridge" linking the two aryl groups. The reduction of the carbon - carbon double bond of chalcone 117 to the ketone 129

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion resulted in a loss of activity, as did the subsequent reduction of the carbonyl functionality of 129 to 130. ${ }^{181}$

Changing the carbon-carbon double bond into an epoxide has been reported to increase the chalcones mutagenic properties by Rashid and co-workers. ${ }^{182}$ This prompted the investigation of the effects of introducing an epoxide to see what effect this would have on cytotoxicity. Interestingly the results obtained showed no significant loss of activity and the chalcone oxide $\mathbf{1 3 1}$ of chalcone $\mathbf{1 3 2}$ displays a slight increase in activity. ${ }^{177}$

132

131
$\mathrm{IC}_{50}(\mathrm{~K} 562) 0.8 \mu \mathrm{M}$

The importance of the $\alpha, \beta$-unsaturated ketone was shown again in a series of ester 133 and amide 134 chalcone derivatives where the $\alpha$-carbon had been replaced with either an oxygen or a nitrogen respectively. Both linker changes caused significant lose in activity when compared to the equivalent chalcone 116. ${ }^{183}$

It has been speculated that the importance of the $\alpha, \beta$-unsaturated ketone to the activity of the compound is down to two possible reasons. The first is that the enone system could undergo nucleophilic attack via a Michael-type addition. Thus strong binding at the colchicine binding site may be the result of the enone system covalent binding to the tubulin. The second reason is that the role of the carbonyl and alkene group is to simply present the two aryl groups in a way that favours strong non-covalent binding to the tubulin.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion Edwards ${ }^{72}$ chalcone study showed that the presence of a methyl group on $\alpha$-position to the carbonyl increased the cytotoxicty of the chalcone when compared to its $\alpha$-hydrogen bearing chalcone equivalent. For instance the $\alpha$ methylchalcone 55 is twice as active as chalcone 135. Edwards gave no explanation for this.

The paper ${ }^{22}$ also reports data on a selection of $\alpha$-halogen bearing chalcones. It showed that the introduction of bromine group onto the $\alpha$ position of the chalcone 136 increased its cytotoxicity, compared to the $\alpha$-bearing chalcone equivalent 135 . While the introduction of the chlorine group decreased the activity of the chalcone 137.

We then decided to investigate the introduction of various groups on the C-2 position of the chalcone to see the effects upon anticancer activity of the compounds and to try and account for the effects these groups have on the activity of the chalcone. It was suspected that the biological effects may be caused by the conformation that the chalcone adopts.

$\mathrm{IC}_{50}$ (HeLa) 12 nM

$\mathrm{IC}_{50}$ (HeLa) 24 nM

$\mathrm{IC}_{50}$ (HeLa) 19 nM
The $\alpha$-methylchalcone of the CA-4 like chalcone 117 was quickly prepared. The $E$-isomer of the CA- 4 like $\alpha$-methyl chalcone 56 was isolated and had an exceptionally impressive $\mathrm{IC}_{50}$ value of 0.21 nM , a 20 fold increase in activity over chalcone 117. While a ( $Z$ )-enriched

$\mathrm{IC}_{50}$ (HeLa) 43 nM mixture of $\mathbf{1 3 8}$ ( $E: Z, 1: 5$ determined by ${ }^{1} \mathrm{H} \mathrm{NMR}$ ) gave an $\mathrm{IC}_{50}$ value of 60 nM . $^{73}$

$\mathrm{IC}_{50}(\mathrm{~K} 562) 4.3 \mathrm{nM}$

$\mathrm{IC}_{50}$ (K562) 0.21 nM

138

Single crystals of chalcones 117 and 56 were obtained by careful diffusion crystallization and their structures determined by X-ray crystal structure analysis (Figure 14 and 15). The crystal structure of $\mathbf{5 6}$ confirmed the $(E)$-configuration of the carbon-carbon double bond.

The X-ray crystal structure of 117 and 56 revealed an interesting relationship between the conformation of the chalcone and its cytotoxicity. The structure of chalcone 117 shows that the carbon-oxygen double bond and the carbon-carbon double bond are positioned in a cis

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion conformation relative to each other around the $\mathrm{C} 1-\mathrm{C} 2$ single bond (illustrated in the s-cis conforner Figure 14). While the more active $\alpha$-methyl chalcone 56 structure shows that its carbon-oxygen double bond and the carbon-carbon double bond are positioned in a trans conformation relative to each other around its C1-C2 single bond (illustrated in the s-trans conforner Figure 15 ).

Figure 14: X-ray crystal structure of chalcone 117

Figure 15: X-ray crystal structure of chalcone 56
These results were supported by a number of examples in the literature showing that the Xray crystal structures of chalcones bearing hydrogen on the $\alpha$-position to the carbonyl adopt the s-cis conformation. ${ }^{18+187}$ A number of chalcones bearing various bulky groups at the $\alpha$ position to the carbonyl, including methoxy, ${ }^{188}$ azido ${ }^{189}$ and pyridinium ${ }^{190}$ groups, for which Xray crystal structures have been determined, adopt the s-trans conformation.

The introduction of various alkoxy groups at the C-2 position of the chalcone has been investigated. ${ }^{191}$ The CA-4 like $\alpha$-methoxychalcone 139 showed the greatest anti-cancer activity of all of the $\alpha$-alkoxychalcones, with an increase in cytotoxicity over the unsubstituted chalcone 117. However it proved to be less toxic than the $\alpha$-methylchalcone 56.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

The effects of varying the size of the alkoxy groups on the C-2 position showed that increasing the size of the alkoxy group led to a slight lose of activity. For example the $\alpha$ methoxychalcone 140 was more active than the $\alpha$-ethoxychalcone 141 , which in turn was more active than the $\alpha$-propoxychalcone 142 .

140
$\mathrm{IC}_{50}(\mathrm{~K} 562) 3.7 \mathrm{nM}$

141
$\mathrm{IC}_{50}$ (K562) 11 nM

142
$\mathrm{IC}_{50}$ (K562) 20 nM

The X-ray crystal structure of $\alpha$-methoxychalcone chalcone 143 shows that $\alpha$ alkoxychalcones adopt the s-trans conformation (Figure 16). ${ }^{191}$

Figure 16: X-ray crystal structure of chalcone 143
A series of aurones 144 (conformationally-restricted analogues of the chalcones) was prepared and assessed for anti-cancer activity. ${ }^{192}$ This was done to investigate the effects of the aryl ring orientation about the rotatable bonds a and c and their influence on the cytotoxicity of the molecule (Figure 17).

56

144

Figure 17: Structure of aurones

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion This study also provided a route for the total synthesis of the aurone $\mathbf{1 4 5}$ isolated from Uvaria hamiltonii by Wani and co-workers. ${ }^{193}$ The $3^{\prime}, 4^{\prime}$-dihydroxy B-ring of extracted aurone 145 and aurone $\mathbf{1 4 6}$ made both aurones fairly inactive, however the replacement of the $4^{\prime}$ hydroxy on the B-ring of $\mathbf{1 4 6}$ with a 4 '-methoxy to give the CA- 4 like aurone 147 causes the cytotoxicity to be significantly increased. The same replacement of the $4^{\prime}$-hydroxy group on 145 with the 4 '-methoxy group 148 decreases the cytotoxicity of the aurone. It seems to suggest that the $5,6,7$-trimethoxy A-ring of 147 is vital for good cytotoxicity, while the 4,5,6trimethoxy A-ring of $\mathbf{1 4 8}$ is detrimental to its activity. ${ }^{192}$

$145 \mathrm{R}=\mathrm{OH}, \mathrm{IC}_{50}(\mathrm{~K} 562) 12 \mu \mathrm{M}$
$148 \mathrm{R}=\mathrm{OMe}, \mathrm{IC}_{50}(\mathrm{~K} 562) 18 \mu \mathrm{M}$

$146 \mathrm{R}=\mathrm{OH}, \mathrm{IC}_{50}(\mathrm{~K} 562) 10 \mu \mathrm{M}$
$147 \mathrm{R}=\mathrm{OMe}, \mathrm{IC}_{50}(\mathrm{~K} 562) 50 \mathrm{nM}$

Using the protocol developed by Wheeler and co-workers ${ }^{194}$ the aurones were transformed into their corresponding flavones by simply heating in the presence of KCN. The most active flavone was the CA-4 like flavone 149. Similar results to those of the aurones were found, with the CA-4 like 6,7,8-trimethoxy A-ring of 149 being vital to the cytotoxicity, and the 5,6,7-trimethoxy A-ring of $\mathbf{1 5 0}$ having a detrimental effect on the activity of the molecule. ${ }^{192}$

$150 \mathrm{IC}_{50}$ (K562) $22 \mu \mathrm{M}$

$149 \mathrm{IC}_{50}(\mathrm{~K} 562) 40 \mathrm{nM}$

The activities of the aurones and flavones nevertheless show a significant decrease in activity compared to the chalcones 117 and 56, indicating the importance of rotational freedom around bond a (Figure 17).

Another group of conformationally-restricted chalcone analogues were prepared, the indanones 151. ${ }^{191}$ This was done to further investigate if the importance of the $\alpha, \beta-$ unsaturated ketone to the activity of the compound. The indanones 151 were prepared via Nazarov cyclization by refluxing the precursor chalcone 152 in trifluoroacetic acid (Scheme 7). ${ }^{195}$

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 7: a. TFA, reflux
The indanones show reasonable cytotoxicity. ${ }^{191}$ However the CA-4 like indanone $\mathbf{1 5 3}$ is significantly less active than its precursor chalcone 117. ${ }^{191}$ This difference in activities isn't really noticed in the fluoro indanone 154 and its precursor chalcone 155 . The indanones 153 and 154 both show modest inhibition of tubulin polymerization (ITP) with IC $_{50}$ (ITP) values of $1.9 \mu \mathrm{M}$ and $4.0 \mu \mathrm{M}$ respectively. ${ }^{191}$ The $\mathrm{IC}_{50}(\mathrm{ITP})$ of 153 is comparable to that of Combretastatin A-4 (58, reported IC s $_{0}($ ITP $)$ varies between $0.5^{179}-2^{180} \mu \mathrm{M}$ ).

$117 \mathrm{R}=\mathrm{OH}, \mathrm{IC}_{50}(\mathrm{~K} 562) 4.3 \mathrm{nM}$
$155 \mathrm{R}=\mathrm{F}, \mathrm{IC}_{50}(\mathrm{~K} 562) 0.3 \mu \mathrm{M}$

$153 \mathrm{R}=\mathrm{OH}, \mathrm{IC}_{50}(\mathrm{~K} 562) 60 \mathrm{nM}$
$154 \mathrm{R}=\mathrm{F}, \mathrm{IC}_{50}(\mathrm{~K} 562) 0.39 \mu \mathrm{M}$

The indanones were then reduced to give the indanols. The indanols show major loss in cytotoxicity, with the CA-4 like indanol 156 being 95 times less active than the precursor indanone 153. ${ }^{191}$

157
$\mathrm{IC}_{50}(\mathrm{~K} 562) 2.1 \mu \mathrm{M}$

156
$\mathrm{IC}_{50}$ (K562) $5.7 \mu \mathrm{M}$

The biological properties of the indanols again show that the carbonyl group is vital to the cytotoxicity of the molecule. However while the indanones are less cytotoxic than their precursor chalcones, they still retain significant anti-cancer activity, supporting the idea that the purpose of the $\alpha, \beta$-unsaturated ketone is to maintain the distance of the two aryl groups in a way that favours strong non-covalent binding to the tubulin. It appears that the ability of

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion the enone system to undergo nucleophilic attack via a Michael-type is not an important determinant of biological activity.

## $3.2 \quad \alpha$-Arylchalcones

Previous studies in our research group have investigated the substitution of the hydrogen on the C-2 of the chalcone with various other groups. This has given several active compounds including (E)-3-(3-hydroxy-4-methoxyphenyl)-1-(3,4,5-trimethoxyphenyl)-2-methylprop-2-en-1-one (56), $\mathrm{IC}_{50}(\mathrm{~K} 562)=0.21 \mathrm{nM} .^{73}$ Other $\mathrm{C}-2$ substitutions that have also been investigated include alkyl $(\mathbf{1 5 8}, \mathbf{1 5 9})$ or an alkoxy $(\mathbf{1 3 9}, \mathbf{1 6 0}, \mathbf{1 6 1})$ groups. ${ }^{177.181,199,196}$

$$
56 \mathrm{R}=\mathrm{Me}, 158 \mathrm{R}=\mathrm{Et}, 159 \mathrm{R}=\operatorname{Pr}
$$

$139 \mathrm{R}=\mathrm{OMe}, 160 \mathrm{R}=\mathrm{OEt}, 161 \mathrm{R}=\mathrm{OPr}$

To further the investigation into the effects of the substitution of the hydrogen on the C-2 of the chalcone, we set out to make a series of $\alpha$-arylchalcones. The effects of this substitution upon the structure (especially the s-cis/s-trans preference) and the biological activity will feature highly in our study.

### 3.2.1 $\alpha$-Arylchalcones - Synthesis, Results and Discussion

The approach to making the series of $\alpha$-arylchalcones 162 we chose was the Suzuki coupling of an $\alpha$-bromochalcone 163 and an arylboronic acid 164 to give the $\alpha$-arylchalcone 162 . This route was chosen due to the large number of commercially available arylboronic acids (Scheme 8).

163

164
a

162

Scheme 8: a. Suzuki coupling conditions
The first step in the synthesis of the $\alpha$-arylchalcones is the preparation of the chalcone $(E)$-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one (165). The chalcone 165, was chosen over the more biological active chalcone

$165 \mathrm{R}=\mathrm{H}, \mathrm{IC}_{50}(\mathrm{~K} 562)=0.1 \mu \mathrm{M}$
$117 \mathrm{R}=\mathrm{OH}, \mathrm{IC}_{50}(\mathrm{~K} 562)=4.3 \mathrm{nM}$ $117^{73,74}$ due to the ease of synthesis and no requirement of protecting groups later in the

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion synthesis. With the chemistry validated we would return to the chalcone 117 later. The chalcone 165 was prepared in an excellent yield using the Claisen-Schmidt condensation ${ }^{178}$ of 3,4,5,-trimethoxyacetophenone with p-anisaldehyde (Scheme 9). Inspection of the ${ }^{1} \mathrm{H}$ NMR spectrum clearly shows that the product chalcone is geometrically pure with only the trans isomer $\left(J_{\mathrm{H} 2}-\mathrm{H} 315.6 \mathrm{~Hz}\right)$ being obtained.

Scheme 9: a. $\mathrm{NaOH}(2 \mathrm{M})(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight, $90 \%$; b. $\mathrm{Br}_{2}\left(1 \mathrm{M}\right.$ in $\left.\mathrm{CHCl}_{3}\right)$, $\mathrm{CHCl}_{3}, \mathrm{~N}_{2}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 99 \%$; c. $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CHCl}_{3}, \mathrm{~N}_{2}, 95^{\circ} \mathrm{C}, 1 \mathrm{~h}, 60 \%$.

A 1 molar solution of bromine in chloroform was then prepared; this solution was used to brominate the double bond of the chalcone 165 . The bromine solution was added to the chalcone in chloroform at $0^{\circ} \mathrm{C}$ (Scheme 9), giving a pink solid 166. The TLC of the product 166 showed 2 spots, however the separation of these 2 products by column chromatography proved to be not trival. The ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product showed that it was approximately $90 \%$ pure (Figure 18) so it was used in the next step without purification.

Figure 18: ${ }^{1} \mathrm{H}$ NMR spectrum of dibrominated chalcone 166

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion We then needed to carry out a dehydrohalogenation reaction to give the $\alpha$-bromochalcone 167. This was first tried by treating 166 dissolved in chloroform, with DBU at room temperature for 30 minutes. This gave a mixture of $E$ and $Z$ isomers. We also performed the reaction at $-30{ }^{\circ} \mathrm{C}$ for 2 hours and this also gave a mixture of isomers. Other $\alpha$ bromochalcones have been made by treating the precursor dibrominated chalcone with triethylamine. ${ }^{197.198}$ So the chalcone in chloroform was refluxed in excess triethylamine for 1 hour. This procedure gave mainly one isomer; however it was noticed that the amount of the secondary isomer started to increase when the NMR sample was left out in the light. So it appeared that the product was light sensitive

The reaction was then repeated but wrapped in aluminium foil, purified by column chromatography and recrystallization from ethyl acetate and hexane, to give fine cream crystals of (Z)-2-bromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one (167) in a reasonable yield (Scheme 9), that was geometrically pure. The $Z$ configuration of the compound was assigned by ${ }^{1}$ H NMR spectral comparison to another ( $Z$ )- $\alpha$-bromochalcone 168 reported by Bose ${ }^{197}$, the peak for the hydrogen attached to
 C3 of 168 was reported to occur at 7.72 ppm . The peak for the hydrogen attached to C3 of the geometrically pure 167 occurs at 7.69 ppm , looking at the crude mixture of the 2 isomers of $\mathbf{1 6 7}$ the peak for the hydrogen on C 3 of the other isomer occurs at 7.31 ppm . Therefore we concluded that the pure isomer isolated was the Z-isomer due to the similarity of the 2 spectral values. The structure was also conformed later by the X-ray crystals of several of the $\alpha$-arylchalcones made from 167 (Figure 19 and 20).

The $\alpha$-arylchalcone library was then to be synthesized by palladium-catalyzed Suzuki coupling of 167 and a selection of boronic acids. ${ }^{199,200}$ First, the palladium catalyst tris(dibenzylideneacetone)dipalladium(0).chloroform (169) had to be made as it is often most active when freshly prepared. The dibenzylideneacetone (170) was prepared by stirring acetone and benzaldehyde in the presence of sodium hydroxide in aqueous ethanol to give the Claisen-Schmidt condensation product as bright yellow crystals (Scheme 10). ${ }^{201}$ Only the trans isomer of dibenzylideneacetone (170) was obtained, this was clearly shown in ${ }^{1} \mathrm{H}$ NMR spectrum with 2 doublets at 7.09 and 7.75 ppm with a coupling constant of 16.2 Hz . $\operatorname{Bis}($ dibenzylideneacetone)palladium $(0)(171)$ was then prepared by heating a mixture of $\mathbf{1 7 0}$, sodium acetate and palladium chloride in methanol at $40^{\circ} \mathrm{C}$ for 4 hours, forming a purple precipitate. This purple precipitate, $\operatorname{bis}($ dibenzylideneacetone) palladium(0)(171), was then recrystallized from hot chloroform to give deep purple crystals of 169 (Scheme 10). ${ }^{202}$

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 10: a. 5 M NaOH , ethanol, r.t. $1 \mathrm{hr}, 50 \%$; b. $\mathrm{NaOAc}, \mathrm{PdCl}_{2}, \mathrm{MeOH}, 40^{\circ} \mathrm{C}, 4 \mathrm{~h}$, $99 \%$; c. $\mathrm{CHCl}_{3}, 74 \%$.

The Suzuki coupling reaction of $\alpha$-bromochalcone 167 and phenylboronic acid using the conditions described by Mull ${ }^{200}$ (Scheme 11) gave (E)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)-2-phenylprop-2-en-1-one (172) isolated as cream fine needles after purification by chromatography and crystallization. Since this method proved successful a series of $\alpha$-arylchalcones 173 - 177 was made from 167 using various substituted commercially available boronic acids.

167

Scheme 11: a. $\mathrm{Pd}_{2}(\mathrm{dba})_{3} . \mathrm{CHCl}_{3}(2 \mathrm{~mol} \%), \mathrm{PPh}_{3}(4 \mathrm{~mol} \%), \mathrm{Et}_{2} \mathrm{NH}$, Toluene, $n \mathrm{PrOH}, \mathrm{H}_{2} \mathrm{O}$, $120^{\circ} \mathrm{C}$, 1 hr , yield (see table 2).

Table 2: $\alpha$-Arylchalcones prepared by Suzuki coupling (see scheme 11).

|  | $\mathrm{R}^{2}$ | $\mathrm{R}^{3}$ | $\mathrm{R}^{4}$ | $\mathrm{R}^{6}$ | Yield (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1 7 2}$ | H | H | H | H | 43 |
| $\mathbf{1 7 3}$ | H | H | OMe | H | 30 |

All the $\alpha$-arylchalcones except 177 were isolated as a single isomer. X-ray crystal structures of the $\alpha$-arylchalcones 173 (Figure 19) and 175 (Figure 20) show that these $\alpha$-arylchalcones have the s-cis conformation around the $\mathrm{C} 1-\mathrm{C} 2$ single bond. The X-ray crystal structures of the $\alpha$-arylchalcones also show their carbon carbon double bond is of the $E$ configuration.

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Figure 19: X-ray crystal structure of chalcone 173

175

Figure 20: X-ray crystal structure of chalcone 175
The ${ }^{1} H$ NMR spectrum of $\alpha$-arylchalcone 177 shows that it is a mixture of the $E$ and $Z$ isomers. The 3:2 ratio favours for the Z-isomer. The H NMR signal of the hydrogen on C3, appears around $7.10-7.25 \mathrm{ppm}$ in the other E-conFigured $\alpha$-arylchalcones. For 177 the olefinic signals occur at 7.13 ppm and 7.40 ppm (Figure 21).

Figure 21: Structure of $E$ and $Z$ isomers of $\alpha$-arylchalcone 177
We then decided to make another $\alpha$-bromochalcone 178 bearing the unsubstituted phenyl group. The starting chalcone $\mathbf{1 7 9}$ was isolated as light yellow crystals after treating 3,4,5-

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion trimethoxyacetophenone and freshly distilled benzaldehyde with the previously mentioned Claisen-Schmidt condensation conditions (Scheme 12). Inspection of the ${ }^{1} \mathrm{H}$ NMR spectrum of the chalcone 179 indicated that only the $E$-isomer had been isolated, shown by the alkene HH coupling ( $J 15.7 \mathrm{~Hz}$ ). The chalcone was then brominated, giving the ketone 180 as a pale pink solid. The ketone 180 was then treated with triethylamine to give $\alpha$-bromochalcone 178 as brown crystals (Scheme 12) which after purification by chromatography and recrystallization from ethyl acetate and hexane gave a single isomer. The olefinic hydrogen of 178 occurred at 7.69 ppm in the ${ }^{1} \mathrm{H}$ NMR spectrum, which was comparable to the olefinic hydrogen peak of the $Z-168$ which is reported to occur at 7.72 ppm in the ${ }^{1} \mathrm{H}$ NMR spectrum. ${ }^{197}$ Therefore we concluded that the pure isomer of 178 isolated was the Z-isomer due to the similarity of the spectral values.

$\mathrm{CHCl}_{3}, \mathrm{~N}_{2}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 99 \%$; c. $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CHCl}_{3}^{-}, \mathrm{N}_{2}, 9{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 41 \%$; b. $\mathrm{Br}_{2}\left(1 \mathrm{M}\right.$ in $\left.\mathrm{CHCl}_{3}\right)$, $\mathrm{CHCl}_{3}, \mathrm{~N}_{2}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 99 \%$; c. $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CHCl}_{3}, \mathrm{~N}_{2}, 9{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 41 \%$.

Suzuki coupling was then carried out with the $\alpha$-bromochalcone 178 and phenylboronic acid as before (Scheme 13). The $\alpha$-arylchalcone 181 was isolated as a yellow oil after purification by chromatography. The ${ }^{1} \mathrm{H}$ NMR spectrum of the 181 showed a mixture of $E$ and $Z$ isomers. Inspection of the methoxy signals in the ${ }^{1} \mathrm{H}$ NMR spectrum indicated that the ratio of the isomers was $1: 2.3$. However due to complexity of the aromatic region of the spectrum of $\mathbf{1 8 1}$ the assignment of the configuration of the two isomers by their olefinic hydrogens could not be made.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 13: a. $\mathrm{Pd}_{2}(\mathrm{dba})_{3} . \mathrm{CHCl}_{3}(2 \mathrm{~mol} \%), \mathrm{PPh}_{3}(4 \mathrm{~mol} \%), \mathrm{Et}_{2} \mathrm{NH}$, Toluene, $n \mathrm{PrOH}, \mathrm{H}_{2} \mathrm{O}$, $120^{\circ} \mathrm{C}, 1 \mathrm{hr}, 52 \%$

Only one $\alpha$-arylchalcone was made from 178, the synthesis of other $\alpha$-arylchalcone was then carried on by others in the group. The other $\alpha$-arylchalcones were synthesized by the acid catalyzed condensation of 1-(3,4,5-trimethoxyphenyl)-2-phenylethanone derivatives and various benzaldehydes (Scheme 14). This route proved to be easier for the synthesis of a larger library of $\alpha$-arylchalcones. However it gave a mixture of $E$ and $Z$-isomers as the product.

Scheme 14: a. Piperidine, AcOH, EtOH, Ar, $110^{\circ} \mathrm{C}, 4$ days, $30 \%$.
The $\alpha$-methylchalcone analogue 182 of $\alpha$-bromochalcone 167 was also synthesized so that its biological properties could be compared with those of the $\alpha$-arylchalcones $172-177$ and 181. To make $\alpha$-methylchalcone 182, we first needed to synthesise the propiophenone 183. One practical route to this compound was via a Grignard reaction to make the alcohol 184, followed by the oxidation with pyridinium chlorochromate (PCC) to give the desired propiophenone 183 in a good yield (Scheme 15).

Scheme 15: a. Magnesium turnings, bromoethane, THF, Ar, r.t., overnight, $97 \%$; b. PCC, DCM, Ar, r.t., overnight, 76\%.

The $\alpha$-methylchalcone 182 was prepared using the acid-catalyzed condensation method described by Edwards and co-workers. ${ }^{72}$ The propiophenone 183 and p-anisaldehyde, dissolved in ethanol, were refluxed in the presence of glacial acetic acid and piperidine

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

(Scheme 16). The water generated by the reaction was removed from the refluxing ethanol as it passed over activated $3-\AA$ molecular sieves packed in the condenser. After purification by column chromatography and recrystallization 182 was isolated in a moderate yield as clear white crystals. The reaction was repeated but using base catalyzed conditions, refluxing the propiophenone 183 and $p$-anisaldehyde in ethanol and the presence of sodium hydroxide for 2 hours. After purification this method gave $\mathbf{1 8 2}$ in only $15 \%$ yield.

Scheme 16: a. Piperidine, $\mathrm{AcOH}, \mathrm{EtOH}, \mathrm{Ar}, 110^{\circ} \mathrm{C}, 4$ days, $30 \%$; b. $\mathrm{NaOH}, \mathrm{EtOH}, \mathrm{Ar}$, $110^{\circ} \mathrm{C}, 2$ hours, $15 \%$.
The ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{1 8 2}$ showed that only a single isomer had been made, and after diffusion crystallisation form ethyl acetate and hexane, the X-ray structure of the crystals showed that the $E$-isomer had been isolated. The structure shown in Figure 22, clearly shows that the molecule adopts the s-trans configuration as we expected.

Figure 22: X-ray crystal structure of $\alpha$-methylchalcone 182

The biological activity of the chalcone 165 had been previously reported as having an $\mathrm{IC}_{50}(\mathrm{~K} 562)$ of $0.1 \mu \mathrm{M}$, however the experimental value this time proved to be significantly lower. The biological results show that the $\alpha$-bromochalcone 167, and its precursor 166, are not as active as the original chalcone 165. The lack of the methoxy in the 4 position on the B ring of chalcone 179 decreases the activity of the chalcone compared to the chalcone 165 which has a methoxy on the 4 position of its B ring. Therefore the presence of a methoxy in the 4 position on $B$ ring increases the activity of the compound. The substitution of $\alpha$ -

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion hydrogen with various substituted phenyl groups 172 - 177 does generally show a significant change in biological activity. The exceptions to this are 176 where there seems to be a slight decrease in activity and 177 which the ${ }^{1} H$ NMR shows as a mixture of $E$ and $Z$ isomers and has had a severe reduction in biological activity. The $\alpha$-methylchalcone 182, as expected also showed a significant increase in biological activity, this increase appears to be more than the increase due to the addition of $\alpha$-phenyl groups. The difference in activity of the 2 compounds may be due to the favoured configuration around the $\mathrm{C} 1-\mathrm{C} 2$ single bond, with the single isomer $\alpha$-phenylchalcones favouring the s-cis conformation (Figures 19 and 20) and the $\alpha$-methylchalcone 182 favouring the $s$-trans conformation around the $\mathrm{C} 1-\mathrm{C} 2$ single bond (Figure 22).

### 3.2.2 $\alpha$-Benzylchalcones - Synthesis, Results and Discussion

Seeing that the reaction to make the $\alpha$-methylchalcone 182 from propiophenone 183 had worked, we decided to try the same reaction but with a chalcone that had been reduced at its carbon-carbon double bond, to make an $\alpha$-benzylchalcone. We took the 2 chalcones that had already been prepared, 165 and 179 and reduced them using a hydrogenation method previously used in the Lawrence group by M. Woo. ${ }^{203}$ The chalcone was dissolved in ethyl acetate, a catalytic amount of $10 \%$ palladium on carbon was added and then the mixture was stirred under a hydrogen atmosphere for 3 hours at room temperature (Scheme 17). The reduced chalcones were then both purified via column chromatography in excellent yields. The ${ }^{1} \mathrm{H}$ NMR of the product showed that peaks for the alkene HH coupling were no longer present and that there were now 2 triplets both with an integration of 2 hydrogen's in the 3.00 - 3.30 region of the spectrum for the newly created methylene groups.

165 \& 179
185-186
Scheme 17: a. $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}$, EtOAc, r.t., 3 hrs, yield (185, $\mathrm{R}^{4^{\prime \prime}}=\mathrm{OMe}, 82 \% ; 186 \mathrm{R}^{4^{\prime \prime}}=$ H, 95\%).

Both the acid catalyzed condensation ${ }^{12}$ and the base catalyzed condensation were attempted with the reduced chalcone and p-anisaldehyde (Scheme 18). Unfortunately neither of these conditions worked and the starting materials were recovered in both cases.

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 18: a. Piperidine, AcOH, EtOH, Ar, $110^{\circ} \mathrm{C}, 4$ days, $0 \%$; b. $\mathrm{NaOH}, \mathrm{EtOH}, \mathrm{Ar}$, $110{ }^{\circ} \mathrm{C}, 24$ hours, $0 \%$.
Another route to the $\alpha$-benzylchalcone 187 was then tried. This time we attempted the Suzuki coupling reaction of the $\alpha$-bromochalcone 167 with $0.5 \mathrm{M} B$-benzyl-9-BBN in THF (Scheme 19). This reaction also didn't work, the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product showed that it was mainly the $\alpha$-bromochalcone 167 , the spectrum also showed traces of the benzyl group in spectrum, with peaks at 4.69 ppm with an integration of two representing the methylene group of the benzyl compound and a multiplet at $7.33-7.39 \mathrm{ppm}$ with an integration of five representing the phenyl group of the possible benzyl compound. The $\alpha$ bromochalcone 167, was then recovered by column chromatography. The $B$-benzyl-9-BBN had probably been removed in the work up of the reaction, which would explain for the trace amounts of it in the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product.

Scheme 19: $\mathrm{a} . \mathrm{Pd}_{2}(\mathrm{dba})_{3} . \mathrm{CHCl}_{3}(2 \mathrm{~mol} \%), \mathrm{PPh}_{3}(4 \mathrm{~mol} \%), \mathrm{Et}_{2} \mathrm{NH}$, Toluene, $n \mathrm{PrOH}, \mathrm{H}_{2} \mathrm{O}$, $120^{\circ} \mathrm{C}, 1 \mathrm{hr}, 0 \%$;

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion
3.2.2.1 Biological results for the reduced chalcones

185-186

| Chalcone | $\mathrm{R}^{4^{\prime \prime}}$ | $\mathrm{IC}_{50}(\mathrm{~K} 562)(\mu \mathrm{M})$ |
| :---: | :---: | :---: |
| $\mathbf{1 8 5}$ | OMe | 2.5 |
| $\mathbf{1 8 6}$ | H | $>10$ |

The effects on the biological activity of the chalcone by reducing its double bond to $\mathbf{1 8 5}$ and 186 resulted in a fall in activity. Thus showing the importance of the double bond to the biological activity of the chalcone structure. The decrease in biological activity resulting from the reduction of the double bond has been previously reported in the group, with chalcones 117 and 56, being more active than their reduced analogues 129 and 189. ${ }^{181.203}$

### 3.2.3 Another route to $\alpha$-arylchalcones - Synthesis, Results and Discussion

As previously mentioned other members of the group made another series of $\alpha$-arylchalcones by the acid catalyzed condensation of 1-(3,4,5-trimethoxyphenyl)-2-phenylethanone derivatives and various benzaldehydes (Scheme 14). The most active compound of this series was the $\alpha$-arylchalcone $190, \mathrm{IC}_{50}(\mathrm{~K} 562) 12 \mathrm{nM}$. However this chalcone was a mixture of $E$ and $Z$ isomers.

To try and prepare 190 as a single isomer we devised a new approach to the synthesis of the $\alpha$-arylchalcones. The key steps in this new synthesis would be the synthesis of acrylic acid

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion 191 to give the B and C ring system and the converision of the acid 191 into the Weinreb amide 192. Finally we hoped that the reaction of 192 with the Grignard reagent 193 would introduce the A ring (Scheme 20).

$$
190
$$

$$
194
$$

## Scheme 20

The acrylic acid was synthesized by means of a Perkin reaction, ${ }^{204}$ where isovanillin (194) and 4-methoxyphenylacetic acid (195) were heated in a mixture of triethylamine and acetic anhydride at $140^{\circ} \mathrm{C}$ for 3 hours, the mixture was then left to cool to room temperature and then acidified with concentrated hydrochloric acid and stirred overnight causing the acrylic acid 191 to precipitate as a cream solid which was then purified by crystallization from hot ethanol and isolated in a moderate yield. The reaction was then repeated again, except this time in the microwave at $170^{\circ} \mathrm{C}$ for 25 min and without the acid workup to see if the phenoxy acetate 196 could be isolated directly. The acetic anhydride and triethylamine were removed via vacuum distillation (Genevac), the product was then purified by chromatography and crystallization from hot ethanol to give the acetate of the corresponding acrylic acid 196 in a moderate yield (Scheme 21).

Scheme 21: a. i $\left(\mathrm{CH}_{3} \mathrm{CO}\right)_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, 140^{\circ} \mathrm{C}, 3 \mathrm{hr}$. ii. Conc. HCl . To give $19137 \%$; b. $\left(\mathrm{CH}_{3} \mathrm{CO}\right)_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, 170{ }^{\circ} \mathrm{C}, 25 \mathrm{~min}$, $\mu$ wave. To give $19639 \%$.

By comparing the values of the ${ }^{1} \mathrm{H}$ NMR chemical shifts for hydrogen on C 3 of the 2 acrylic acid obtained to similar compounds in literature it appears that we have isolated the desired $E$ conFigured isomers. The $E$ and $Z$ isomers of 3-(4'-methoxy-3'-nitrophenyl)-2-(3'', $4^{\prime \prime}, 5$ ''trimethoxyphenyl)acrylic acids (197) were reported by Borrel ${ }^{204}$, and the ${ }^{1}$ H NMNR chemical shift value for hydrogen on C 3 for the $E$ isomer appears at 7.70 ppm while the $Z$ isomer appears at 7.10 ppm . The ${ }^{1} \mathrm{H}$ NMNR chemical shift value for hydrogen on C 3 of 191 is 7.56 ppm and 1967.62 ppm , and both appear to be the $E$ isomer when compared to the values of 197 (Figure 23).

Figure 23: 'H NMR comparisons of 191 and 196 to 197
The protected acrylic acid 196 was then dissolved in chloroform and refluxed with thionyl chloride for 4 hours ${ }^{205}$ to give the acid chloride 198 in an excellent yield (Scheme 22). The Weinreb amide 199 was then obtained by treating the acid chloride 198 with $N, O-$ dimethylhydroxyamine hydrochloride, in the presence of pyridine at $0{ }^{\circ} \mathrm{C}$. ${ }^{206}$ The amide 199 was purified by chromatography as a pale yellow oil in good yield (Scheme 22).

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 22: a. $\mathrm{SOCl}_{2}, \mathrm{CHCl}_{3}, 75^{\circ} \mathrm{C}, 4 \mathrm{hr}, 93 \%$; b. MeNHOMe. HCl , pyridine, $\mathrm{CHCl}_{3}, 0$ ${ }^{\circ} \mathrm{C}, 1 \mathrm{hr}, 70 \%$.

The Grignard reagent 193 was prepared in freshly distilled anhydrous THF, by gently heating magnesium turnings with 5-bromo-1,2,3-trimethoxybenzene (200) in the presence of a single iodine crystal, under an argon atmosphere. ${ }^{99,207}$ When the reaction started the iodine discolouring disappeared and the mixture became clear, it was heated at $65^{\circ} \mathrm{C}$ for an hour, and then stirred at room temperature for an hour (Scheme 23). The Weinreb amide 199 was then treated with a slight excess of the Grignard reagent 193 at $0^{\circ} \mathrm{C}$, and then left to stir at room temperature overnight (Scheme 23). The NMR spectrum of the crude reaction product showed that the reaction had not been successful and Weinreb amide 199 was recovered by chromatography, in a $66 \%$ yield. The spectrum also showed the presence of the quenched Grignard reagent 201, with a triplet with an integration of one proton at 7.00 ppm and doublet with an integration of two protons at 6.59 ppm . The trimethoxy benzene 201 was not isolated.

Scheme 23: a. Mg, THF, $\mathrm{I}_{2}, 65^{\circ} \mathrm{C}$, 1 hr ; b. THF, $0^{\circ} \mathrm{C}$ to r.t., overnight, $19966 \%$.
The reaction was then attempted again, however this time the organolithium reagent 202 was used instead. The organolithium reagent 202 was prepared using the procedure reported by Chen ${ }^{208}$, where 5-bromo-1,2,3-trimethoxybenzene (200) dissolved in ether was added to

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion solution of $n$-butyllithium in ether at $-78^{\circ} \mathrm{C}$, and stirred for an hour at this temperature (Scheme 24). The Weinreb amide 199 was then dissolved in THF and chilled to $-78{ }^{\circ} \mathrm{C}$ under an argon atmosphere, then 2.3 equivalents of the organolithium reagent 202 in ether was added to the mixture, and stirred at $-78^{\circ} \mathrm{C}$ for a further hour. The mixture was then stirred overnight at room temperature. Unfortunately this reaction did not work, and the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude reaction mixture showed that the Weinreb amide 199 had become deprotected giving 203, which was isolated by chromatography (Scheme 24). It would have been deprotected by the excess amount of $n$-butyllithium used to make 202. The ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product also showed the presence of the quenched organolithium reagent 201 as previously mentioned.

Scheme 24: a. $n \mathrm{BuLi}(2 \mathrm{eqv})$, ether, $-78^{\circ} \mathrm{C}, 1 \mathrm{hr}$; b. 202 (2.3 eqv), THF, $-78^{\circ} \mathrm{C}$ to r.t., overnight, 58\%.

### 3.2.3.1 Biological results for the $\alpha$-arylchalcones

191, 196, 199, 203

| Compound | $\mathrm{R}^{1}$ | $\mathrm{R}^{3 "}$ | $\mathrm{IC}_{50}(\mathrm{~K} 562)(\mu \mathrm{M})$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{1 9 1}$ | OH | OH | $>10$ |
| $\mathbf{1 9 6}$ | OH | OAc | $>10$ |
| $\mathbf{1 9 9}$ | $\mathrm{~N}(\mathrm{OMe}) \mathrm{Me}$ | OAc | $>10$ |
| $\mathbf{2 0 3}$ | $\mathrm{~N}(\mathrm{OMe}) \mathrm{Me}$ | OH | 8.3 |

None of the above compounds proved to be particularly biologically active. The compounds are similar to Combretastatin A-4 (58), with a 4-methoxyphenyl A-ring instead of a 3,4,5trimethoxyphenyl A-ring and a substituted group on the ethene linker. It has generally been accepted that A-ring of CA4 (58) must be 3,4,5-trimethoxyphenyl for the compound to maintain its cytotoxicity, ${ }^{79}$ and the presence of a 4-methoxyphenyl A-ring may partially be the cause of the low biological activity of the compounds $191,196,199$ and 203. Recent SAR studies of Combretastatin A-4 (58) has shown that introduction of alkyl groups ${ }^{91}$ and

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion acylamide groups ${ }^{92}$ onto the ethene linker decreases the cytotoxicity of the CA4 analogues, this shows that the presence of various groups attached to the ethene linker of CA4 (58) will reduce its cytotoxicity. Therefore the low activity of 191, 196, 199 and 203 is also be due to the presence of the carboxylic acid group on 191 and 196 or the Weinreb amide on 199 and 203 attached to the ethene linker.

$\mathrm{IC}_{50}(\mathrm{~K} 562) 1 \mathrm{nM} \quad \mathrm{IC}_{50}(\mathrm{~K} 562) 0.04 \mu \mathrm{M} \quad \mathrm{IC}_{50}$ (MCF-7) $1.13 \mu \mathrm{M}$ $\mathrm{IC}_{50}$ (MCF-7) 69 nM

### 3.3 Indanones and Indenones

Research previously done by the group has shown that the s-trans conformation around the double bond of the chalcone 56 has proven important to its biological activity. ${ }^{73}$ Therefore we have decided to investigate this effect, by making indanones 151 and indenones 204 as conformationally constrained analogs of the chalcones that mimic the s-trans arrangement.

### 3.3.1 Indanones - Synthesis, Results and Discussion

The indanone scaffold can be constructed from chalcones through catalyzed Nazarov cyclization. ${ }^{209-211}$ Literature shows that the preparation of indanones involves heating a chalcone in the presence of Lewis acids like aluminum chloride ${ }^{212}$ and boron trifloride ${ }^{213}$ or strong protic acids such as polyphosphonic acid ${ }^{214}$ or trifluoroacetic acid (TFA). ${ }^{195}$ The key step in this synthesis to make the indanones will be TFA catalyzed Nazarov cyclization of chalcones (Scheme 25).

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 25: a. TFA, reflux
The chalcone 117 was prepared in a good yield using the Claisen-Schmidt condensation ${ }^{178}$ of 3,4,5-trimethoxyacetophenone with isovanillin (Scheme 26). After an acid work up and recrystallization form aqueous methanol, the geometrically pure chalcone 117 was obtained, with the ${ }^{1} \mathrm{H}$ NMR spectrum showing that only the trans isomer ( $J_{\mathrm{H} 2-\mathrm{H} 3} 15.4 \mathrm{~Hz}$ ) was present.

Scheme 26: $\mathrm{a} . \mathrm{NaOH}$ (2M) (aq), MeOH , r.t., overnight, $69 \%$.
Then using the conditions described by Rice and coworkers ${ }^{215}$ the indanones 205 and 153 were prepared respectively from the chalcones 165 and 117 which were dissolved in neat TFA and heated at $120^{\circ} \mathrm{C}$ for 4 hours in a sealed tube (Scheme 27).

165, 117

205, 153

Scheme 27: a. TFA, sealed tube, $120^{\circ} \mathrm{C}, 4$ hours, yield (205, $\mathrm{R}^{3^{\prime \prime}}=\mathrm{H}, 72 \% ; 153 \mathrm{R}^{3^{\prime \prime}}=$ OH, 63\%).

The indanones were then purified by column chromatography and characterised. The ${ }^{1} \mathrm{H}$ NMR spectrum of the indanone 153 (Figure 24) shows key diagnostic peaks of a classic ABX system that occur at $2.57\left(1 \mathrm{H}_{\mathrm{a}}\right.$, dd, $\left.J 2.5,19.3 \mathrm{~Hz}, \mathrm{H}-2 \mathrm{a}\right), 3.15\left(1 \mathrm{H}_{\mathrm{b}}, \mathrm{dd}, J 7.9,19.3 \mathrm{~Hz}\right.$, $\mathrm{H}-2 \mathrm{~b})$ and $4.50\left(1 \mathrm{H}_{\mathrm{x}}, \mathrm{dd}, J 2.5,7.9 \mathrm{~Hz}, \mathrm{H}-3\right) \mathrm{ppm}$.

Figure 24: ${ }^{1} \mathrm{H}$ NMR of indanone 153
We were then intrigued to see if the use of a microwave to heat the reaction would shorten the time of the reaction and give us a way of quickly producing a library of indanones. The use of microwave irradiation in organic synthesis has now become a widely adopted process as an alternative to traditional heating methods. The process of microwave irradiation often results in higher yields, shorter reaction time and less impurities, ${ }^{216-220}$ and is more energy efficient than traditional heating. ${ }^{221}$ It is also an operationally simple process. There is no need to set up an oil bath. The reactor also allows the reaction to be performed safely at temperatures well above the usual boiling point of the solvent.

The first attempt at using microwave irradiation instead of traditional heating was performed on chalcone 165 on a 600 mg scale. The chalcone was dissolved in TFA ( 0.7 mL ) in a microwave reaction vessel and heated to $60^{\circ} \mathrm{C}$ (power 50 W ) for 5 minutes. Analysis of the resulting mixture by TLC showed that the reaction was still mainly starting material. Further heating at $70^{\circ} \mathrm{C}$ (power 100 W ) for 10 minutes showed that the resulted in an incomplete reaction; the indanone 205 was visible in the TLC plate. The mixture was then heated at 120 ${ }^{\circ} \mathrm{C}$ (power 100 W ) for 10 minutes and the TLC of reaction showed that the reaction had gone to completion. The indanone was then isolated by column chromatography in a $50 \%$ yield. The reaction was then repeated using the following conditions, 900 mg scale, TFA ( 1 mL ), $120^{\circ} \mathrm{C}$ (power 100 W ) for 20 minutes, after purification by column chromatography the indanone was obtained in a $60 \%$ yield (Scheme 28).

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 28: a. TFA, $\mu$ wave, $120^{\circ} \mathrm{C}(100 \mathrm{~W}), 20$ mins, $60 \%$.
A series of chalcones $\mathbf{1 5 5}, \mathbf{2 0 6} \mathbf{- 2 2 0}$, were then prepared using the Claisen-Schmidt condensation ${ }^{178}$ of $3,4,5$-trimethoxyacetophenone and various substituted benzaldehydes (Scheme 29). The chalcones, which precipitate from the reaction mixture were filtered off and purified by recrystallization from methanol. The ${ }^{1} \mathrm{H}$ NMR spectra of the obtained chalcones showed that they had all been isolated as the geometrically pure $E$ isomer, shown by the alkene coupling $\approx 15-16 \mathrm{~Hz}$. Whilst this assignment was not in doubt the X-ray crystal structures of chalcone 209 further showed that the $E$ isomer had been obtained (Figure 24).

Figure 24: X-ray crystal structure of chalcone 209

The benzaldehyde 221 used to make chalcone 216 was prepared by heating 4-hydroxy benzaldehyde in DMF with benzyl bromide and potassium carbonate at $90^{\circ} \mathrm{C}$ for 2 hours. After column chromatography 4-(benzyloxy)benzaldehyde (221) ${ }^{222}$ was isolated as a pale yellow solid in an excellent yield (Scheme 30). The benzaldehyde had to be protected because of the electron-donating effect of the hydroxy group (deprotonated under the reaction conditions) significantly reduces the electrophilicity of the carbonyl group.

Scheme 30: a. $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF, $90^{\circ} \mathrm{C}, 2$ hours, $96 \%$; b. 3,4,5-trimethoxyacetophenone, $\mathrm{NaOH}(2 \mathrm{M})(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight, $42 \%$.

The indanones $153,154,222$ - 234 were all then prepared using the microwave method, on a 250 mg scale in TFA ( 0.3 mL ) (Scheme 31). They were all isolated after purification by column chromatography in poor to good yields (Table 4). The TFA promoted Nazarov cyclization of the benzyl protected chalcone 216 cleaves the benzyl group giving the unprotected indanone 235, but only in a poor yield. The chalcones 218 - $\mathbf{2 2 0}$ were also used in the microwave synthesis of the indanones, however there reactions failed and were not

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion further investigated. These examples have electron rich B-rings which generally reduce the efficiency of the Nazarov cyclization (see later).

Scheme 31: a. TFA, $\mu$ wave, $120^{\circ} \mathrm{C}(100 \mathrm{~W}), 20$ mins, yield (see table 4).

Two of the indanones (228 and 230) ${ }^{1} \mathrm{H}$ NMR spectra (Figure 26 and Figure 27) showed line broadening for peaks on the B ring and hydrogens $\mathrm{H}-2$ and $\mathrm{H}-3$ of the indanone due to bulky groups on the B ring causing steric hindrance and inhibiting its free rotation around the $\mathrm{C}-3$ C-1' bond (Figure 25). While the 2 bulky chlorine groups on C-2' and C-6' of the B ring of indanone 229 allow for no rotation at all (or at least slow rotation on the NMR timescale) and gives three signals for the hydrogen's on the B ring, since H3' ${ }^{\prime}$ and H 5 '" are no longer equivalent (Figure 28). All three indaones 228-230 have the hydrogen $\mathrm{H}-3$ signal shifted slightly down field due to the bulky effect of the groups on there C-2' and C-6'. The degree of shielding from the B ring is dependent on its rotation around the $\mathrm{C}-3-\mathrm{C}-1$ ' bond. The shielding effect on the $\mathrm{H}-3$ hydrogen from the B ring attached to $\mathrm{C}-3$ is reduced due to the orientation the B ring is forced to take by its bulky ortho group. The decreased shielding effect causes the signal for the hydrogen H-3 signal to be shifted further downfield.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

The degree of shielding from the B ring is dependent on the rotation around the bond $\mathrm{C}-3-\mathrm{C}-1$ '.
Cl Bulky ortho groups attached to the B ring will force it into a more static orientation, decreasing its shielding effect on the $\mathrm{H}-3$, by impeding the rotation of the aromatic group around the C-3-C-1' bond.

Figure 25: Steric hindrance inhibiting free rotation around C-3 C-1'' bond.

Figure 27: ${ }^{1} \mathrm{H}$ NMR of indanone 230

Figure 28: ${ }^{1} \mathrm{H}$ NMR of indanone 229
A small series of chalcones $\mathbf{2 3 5} \mathbf{- 2 4 4}$ were made from 3,4-dimethoxyacetophenone and various benzaldehydes using the Claisen-Schmidt condensation ${ }^{178}$ (Scheme 32). All of the chalcones were isolated as the $E$ isomers after recrystallization from methanol. The geometry of the chalcones was as usual determined by the alkene coupling value $\approx 15-16 \mathrm{~Hz}$ in the ${ }^{1} \mathrm{H}$ NMR spectra of the chalcones.

235-244
Scheme 32: a. NaOH (2M) (aq), MeOH, r.t., overnight, yield (see table 5).

| $\mathbf{2 4 3}$ | 3,5-Dimethoxyphenyl | 62 |
| $\mathbf{2 4 4}$ | 2,6-Dimethoxyphenyl | 61 |

The dimethoxyindanones $\mathbf{2 4 5}$ - $\mathbf{2 5 0}$ were then prepared from their precursor chalcones $\mathbf{2 3 5}$ 240 using the same microwave conditions as previously described (Scheme 33) and isolated by column chromatography. The 3,4-dimethoxychalcones 241-244 were also used in the microwave synthesis of the dimethoxyindanones, however these four reactions failed and were not further investigated. Again these examples have electron rich B-rings (see later).

Scheme 33: a. TFA, $\mu$ wave, $120^{\circ} \mathrm{C}(100 \mathrm{~W}), 20$ mins, yield (see table 6).

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion The ${ }^{1} H$ NMR spectra of the indanones $245-247$ and $249-250$ all showed the key peaks and coupling patterns for the $\mathrm{H}-2$ and $\mathrm{H}-3$ atoms as previously described for indanone 153. However the indanone 248 2,6-dichlorophenyl B ring inhibited the free rotation of the phenyl around the $\mathrm{C}-3-\mathrm{C}-1^{\prime}$ ' bond, again causing the hydrogens at position $\mathrm{H}-3^{\prime}$, and $\mathrm{H}-5^{\prime}$ on the B ring to become non equivalent. The ${ }^{1} \mathrm{H}$ NMR spectrum of indanone 248 shows that one of the hydrogens at position $\mathrm{H}-3^{\prime}$ or $\mathrm{H}-5^{\prime}$ occurs at $7.43(1 \mathrm{H}, \mathrm{dd}, J 1.4,7.8 \mathrm{~Hz})$ ppm the other signal for the hydrogen at position $\mathrm{H}-3^{\prime}$ or $\mathrm{H}-5^{\prime}$ occurs under the multiplet at $7.16-7.23 \mathrm{ppm}$ (Figure 29). Also the hydrogen $\mathrm{H}-3$ has its peak shifted down field from around 4.50 ppm to 5.43 ppm by reduced shielding effect of the bulky 2,6-dichlorophenyl B ring of 248 , similar to

248 same affect seen in the hindered indanones 228-230.

Figure 29: ${ }^{1} \mathrm{H}$ NMR of indanone 248
Inspection of the tables 4 and 6 show that the Nazarov cyclization works best for the electron-deficient B-ring systems like 229, 230 and $\mathbf{2 4 8}$. The presence of an electron donating $p$-alkoxy group on the B-ring like 227, 228 and $\mathbf{2 4 5}$ has a detrimental effect on the yield of the indanone. The detrimental effect on the indanone formation of electron donating $p$-alkoxy group on the B-ring was further shown in the failed indanone formations from chalcones 218-219 and 241-243. This is expected because the Nazarov cyclization is an electrophilic substitution process which requires an electron-rich A-ring system which can donate electrons to an electron deficient enone reaction partner (Scheme 34). So the methoxy groups on the A ring are not only necessary for good tubulin binding properties but also increase the precursor chalcone reactivity in the cyclization.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 34: The mechanism of the Nazarov cyclization of electron-rich A-ring chalcones
It was found that the TFA used in the microwave reaction should ideally be anhydrous. We found that the synthesis of indanone 249 using TFA as supplied was problematic. The ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product of 249 showed the formation of a $2.5: 1$ mixture of 3,4dimethoxyacetophenone and 249. It appeared that the presence of water in the TFA had caused the precursor chalcone 249 to undergo a water promoted retro-Michael retro-aldol process to give the 3,4-dimethoxyacetophenone. The TFA was then dried over phosphorus pentoxide for 12 hours under an atmosphere of argon followed by distillation (bp $74-75$ ${ }^{\circ} \mathrm{C} / 1 \mathrm{~atm}$.). ${ }^{223}$ When the reaction to make indanone 249 was repeated with anhydrous TFA, the crude ${ }^{1} \mathrm{H}$ NMR showed no trace of 3,4-dimethoxyacetophenone and 249 was isolated in a $41 \%$ yield.

Chalcones can also be prepared by acid-catalyzed conditions. ${ }^{224}$ With this in mind we tried a one-pot reaction using 3,4,5-trimethoxyacetophenone with p-anisaldehyde in TFA in the hope that the acid conditions would affect both the aldol condensation to give the chalcone 165, which would then undergo the Nazarov reaction to give indanone 205 (Scheme 35). After purification by chromatography the indanone was isolated in a $31 \%$ yield, however the NMR of the product showed it to be a mixture of the indanone 205 and 3,4,5,trimethoxyacetophenone in a ratio of $1: 2.3$ respectively. Further purification of the indanone was not trivial and this method was not investigated any further. For comparison the two step synthesis of indanone 205 give an overall yield of $54 \%, 90 \%$ for the chalcone formation and $60 \%$ for the Nazarov cyclization.

Scheme 35: a. TFA, $\mu$ wave, $120^{\circ} \mathrm{C}$ ( 100 W ), 20 mins, $31 \%$.

Generally the chalcones with the 3,4,5-trimethoxyphenyl A rings tend to show more biological activity against the leukaemia cell line K562 than their 3,4-dimethoxyphenyl A ring analogues. For instance looking at the two chalcones with 4-methoxyphenyl B ring 165 and 235, the 3,4,5-trimethoxyphenyl A ring chalcone 165 has much higher $\mathrm{IC}_{50}(\mathrm{~K} 562)$ value of $1.6 \mu \mathrm{M}$, compared to the 3,4 -dimethoxyphenyl A ring chalcone 235 , which has an $\mathrm{IC}_{50}(\mathrm{~K} 562)$ value of $>10 \mu \mathrm{M}$. This shows that the presence of the 3,4,5-trimethoxyphenyl A ring is an important feature of the overall cytotoxicity of the chalcone. However the 3,4dimethoxyphenyl A ring chalcones with either a 4-chlorophenyl B ring $237\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=8.9\right.$ $\mu \mathrm{M}]$ or a 2,6 -dichlorophenyl B ring $238\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=1.2 \mu \mathrm{M}\right]$ show a higher biological activity than their $3,4,5$-trimethoxyphenyl A ring chalcone equivalents with a 4 -chlorophenyl B ring $206\left[\mathrm{IC}_{50}(\mathrm{~K} 562)>10 \mu \mathrm{M}\right]$ and 2,6-dichlorophenyl B ring $213\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=4.3 \mu \mathrm{M}\right]$.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion In some cases the indanones show increased biological activity over their precursor chalcones. For instance the indanones $232\left[\mathrm{IC}_{50}(\mathrm{~K} 562) 0.081 \mu \mathrm{M}\right]$ and 245 [ $\mathrm{IC}_{50}(\mathrm{~K} 562) 0.17$ $\mu \mathrm{M}$ ] show a significant increase in biological activity compared to their precursor chalcones $215\left[\mathrm{IC}_{50}(\mathrm{~K} 562) 4.0 \mu \mathrm{M}\right]$ and $235\left[\mathrm{IC}_{50}(\mathrm{~K} 562)>10 \mu \mathrm{M}\right]$. However this is not always the case. The indanones 225 [ $\left.\mathrm{IC}_{50}(\mathrm{~K} 562) 2.41 \mu \mathrm{M}\right]$ and 234 [ $\left.\mathrm{IC}_{50}(\mathrm{~K} 562) 0.22 \mu \mathrm{M}\right]$ both show a decrease in the biological activity when compared to there precursor chalcones 209 [ $\mathrm{IC}_{50}$ (K562) $1.48 \mu \mathrm{M}$ ] and 217 [ $\left.\mathrm{IC}_{50}(\mathrm{~K} 562) 0.08 \mu \mathrm{M}\right]$.

The biological results of the indanones $153,154,205,232,234$ and 245 , show that they are all potent inhibitors of K 562 cell growth with $\mathrm{IC}_{50}$ values less than $0.5 \mu \mathrm{M}$.

### 3.3.2 Indenones - Synthesis, Results and Discussion

The indenone scaffold is another conformationally constrained analog of the CA-4 like chalcones locked in the s-trans arrangement. It retains an $\alpha, \beta$-unsaturated enone and lacks the indanone stereogenic centre and is therefore worthy of study. Clark and co-workers used an internal Heck reaction to form the Indenone scaffold from a 2'-bromochalcone. ${ }^{225}$ Using the same idea the key step in making the CA-4 like Indenone scaffold will be the preparation of the precursor chalcone and the internal Heck reaction of a 2'-bromo chalcone (Scheme 36).

## Scheme 36

To make the 2'-bromochalcone precursors we first had to prepare the 2'bromoacetophenone 251. We set about doing this by first refluxing 3,4,5trimethoxybenzaldehyde with $N$-bromo succinimide (NBS) in chloroform for 4 hours to give the 2-bromo-3,4,5-timethoxybenzaldehyde (252), which was isolated after column chromatography in a good yield (Scheme 37). ${ }^{226}$ We then used commercially available 3 molar methylmagnesium chloride in THF to carry out the Grignard reaction on 252 to give the secondary alcohol 253 as pale yellow oil in an excellent yield (Scheme 37). We originally tried to make the Grignard reagent insitu by reacting iodomethane with magnesium turnings in anhydrous THF, however this caused a grey precipitate to form. Since methylchloride is a gas we thought the preparation of methylmagnesium chloride would be troublesome. The alcohol 253 was then oxidized with pyridinium chlorochromate (PCC) to give the desired acetophenone 251 in a good yield (Scheme 37). The PCC oxidation was carried out in the presence of silica gel ( 5 times the mass of PCC) too stop

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion the reaction from becoming to viscous, by providing a support upon which reduced chromium species can precipitate. The reaction work-up is also convenient as the solvent can simply be removed to provide the crude reaction product supported on silica for use directly on a chromatography column.

Scheme 37: a. NBS, $\mathrm{CHCl}_{3}, 75^{\circ} \mathrm{C}, 4$ hours, $83 \%$; b. $\mathrm{MeMgCl}\left(3 \mathrm{M}\right.$ in THF), $\mathrm{THF}, 0^{\circ} \mathrm{C}$ to r.t., 12 hours, $99 \%$; c. PCC, DCM, r.t., 12 hours, $83 \%$.

The two chalcones 254 and 255 were prepared using the Claisen-Schmidt condensation ${ }^{178}$ of 251 and their corresponding benzaldehyde, and purified by recrystallization from methanol (Scheme 38). The chalcones were only isolated as $E$ isomers, as shown by the usual alkene coupling value $\approx 15-16 \mathrm{~Hz}$ in the ${ }^{1} \mathrm{H}$ NMR spectra.

Scheme 38: a. NaOH (2M) (aq), MeOH, r.t., overnight.
Then using the conditions described by Clark ${ }^{225}$ the internal Heck reaction was carried out on 1 mmol scale of chalcone 254 (Scheme 39). After purification by chromatography and recrystallization from ethyl acetate and hexane the indenone 256 was isolated in a high yield as bright red crystals. The key diagnostic peak of the indenone $\mathbf{2 5 6}$ is singlet at 5.73 ppm for the alkene hydrogen $\mathrm{H}-2$ (Figure 30 ). The reaction was repeated using chalcone 255, however no indenone was isolated and only starting material was recovered. This prompted us to investigate the use of various protecting groups to mask the phenol group, which we believe was the cause of the failure to make the indenone.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 39: a. $\mathrm{PdCl}_{2}$ (2.5 mol\%), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{DMF}, 110^{\circ} \mathrm{C}, 30 \mathrm{mins}, 88 \%$.

Figure 30: ${ }^{1} \mathrm{H}$ NMR spectrum of indenone 256
Several protected chalcones 257 - $\mathbf{2 6 0}$ were prepared. The chalcone $\mathbf{2 5 5}$ was protected with tert-butylchlorodimethylsilane chloride (TBDMSCl), by reaction with TBDMSCl for 3 days at room temperature. The protected chalcone 257 was isolated via column chromatography in a good yield as a pale yellow oil that eventually solidified (Scheme 40).

Scheme 40: a. TBDMSCl, imidazole, DMF, r.t., 3 days, $89 \%$;
The intramolecular Heck reaction ${ }^{225}$ of the TBDMS protected chalcones 257 was then carried out (Scheme 42). Unfortunately the preparation of the protected indenone 261 failed and the unprotected chalcone 255 was recovered. Clearly the TBDMS group is not suitable as a phenol protecting group for the reaction conditions used.

Other protected chalcones were therefore required. Three protected versions of the isovanillin starting material were prepared, benzyl protected ${ }^{222} 262$, isopropyl protected ${ }^{227} 263$

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion and methoxymethyl (MOM) protected ${ }^{228} 264$ (Scheme 41). These protected benzaldehydes were then reacted with 251 using the Claisen-Schmidt condensation ${ }^{178}$ to make the protected chalcones 258-260. Chalcones 258-260 were all isolated as pure $E$ isomers after recrystallization from methanol.

Scheme 41: a. Benzyl bromide, $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF, $90^{\circ} \mathrm{C}, 2$ hours, $99 \%$; b. Isopropyl bromide, $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF, r.t. 2 days, $88 \%$; c. $\mathrm{MOMCl}, \mathrm{NaH}, \mathrm{DMF}, 0^{\circ} \mathrm{C}$ to r.t., $88 \%$; d. $\mathrm{NaOH}(2 \mathrm{M})(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight.

After heating the MOM protected chalcone 260 in the previous conditions used for the intramolecular Heck reaction ${ }^{225}$ for 30 minutes the reaction had not gone to completion (Scheme 42). So the mixture was heated at $110^{\circ} \mathrm{C}$ for 8 hours, however after this time the reaction still had not gone to completion and the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product showed that it was a 1:1 mix of chalcone 260 and indenone 265 . The separation of $\mathbf{2 6 0}$ and 265 by column chromatography proved to be hard because the 2 compounds co-spotted on the TLC plate.

Scheme 42: a. $\mathrm{PdCl}_{2}$ (2.5 mol\%), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{DMF}, 110^{\circ} \mathrm{C}, 30 \mathrm{mins}$;
The benzyl protected indenone was prepared from 258 using the intramolecular Heck reaction ${ }^{225}$ previously described as a red solid which was isolated via chromatography in a

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion good yield (Scheme 42). To remove the benzyl group from the indenone 266 hydrogenation with $10 \%$ palladium on carbon and hydrogen was attempted (Scheme 43). Unfortunately this reaction failed and the starting indenone 266 was recovered. We then tried using trimethylsilyl iodide ${ }^{229}$ to cleave the benzyl ether. After ten minutes the reaction was quenched with methanol and was worked up. Unfortunately the ${ }^{1}$ H NMR spectrum showed that the compound had decomposed and neither starting material nor product could be recovered from the mixture (Scheme 43). Trimethylsilyl iodide cleaves ether groups, so it may have reacted with the methoxy groups on the indenone as well as the benzyl ether.

Scheme 43: a. $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}$, r.t., 30 mins ; b. $\mathrm{Me}_{3} \mathrm{SiI}, \mathrm{CHCl}_{3}$, r.t., 10 mins.
The intramolecular Heck reaction ${ }^{225}$ was carried out on the isopropyl protected chalcone 259 to prepare the isopropyl-protected indenone 267 in a moderate yield as red crystals after recrystallization from ethyl acetate and hexane (Scheme 42). We then tried to deprotect the isopropyl-protected indenone 267 by treating it with 1M boron trichloride in heptane (Scheme 44). ${ }^{227}$ Unfortunately the reaction caused the compound 267 to decompose and no phenol could be recovered from the resulting reaction product.

Scheme 44: a. $1 \mathrm{M} \mathrm{BCl}_{3}$ in heptane, EtOAc, $0^{\circ} \mathrm{C}, 6 \mathrm{hrs}$.
The preparation of the MOM-protected indenone 265 was then attempted again, this time using microwave irradiation instead of traditional heating, to see if the reaction could be pushed to completion. The reaction was performed in a microwave vessel at $160^{\circ} \mathrm{C}, 150 \mathrm{~W}$, for 15 minutes (Scheme 45). The reaction proved to be capricious, one attempt on a 100 mg scale gave a $91 \%$ crude yield of 265 and another time using the same conditions but on a larger scale of 260 mg the reaction did not go to completion. After careful column chromatography using the Flashmaster system only $19 \%$ of the indenone 265 was isolated

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion from the chalcone $\mathbf{2 6 0}$ /indenone $\mathbf{2 6 5}$ mix. More indenone could possibly have been isolated from the mixture by repeat chromatography (Scheme 45). Maybe if the reaction was repeated for a longer time on a 260 mg scale the reaction would have gone to completion.

Scheme 45: a. $\mathrm{PdCl}_{2}$ ( $2.5 \mathrm{~mol} \%$ ), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF, $\mu$ wave, $160^{\circ} \mathrm{C}(150$ W), $15 \mathrm{mins}, 100 \mathrm{mg}$ scale crude $91 \%, 260 \mathrm{mg}$ scale $19 \%$.

The deprotection of the MOM-protected indenone 265 was carried out by refluxing the compound in methanol and in the presence of 3 M hydrochloric acid for 45 minutes (Scheme 46). ${ }^{230}$ This deprotection method gave only a $12 \%$ yield of indenone 268, however it also gave the side product 269 in a $30 \%$ yield corresponding to the addition of methanol across the C2-C3 double bond. The ${ }^{1} \mathrm{H}$ NMR spectrum of 269 showed the presence of an extra methoxy signal, also the key diagnostic peak of the alkene hydrogen $\mathrm{H}-2$ of the indenone 268 which appears at 5.73 ppm was no longer present in the spectrum of 269 indicating that the alkene bond was no longer present in the molecule. The signal at 51.73 ppm in the ${ }^{13} \mathrm{C}$ NMR and DEPT spectrum of 269 showed that the molecule possesses a methylene group, this was further confirmed by the key diagnostic peaks of a AB system that occur at $\delta 2.92\left(1 \mathrm{H}_{\mathrm{a}}, \mathrm{d}, J\right.$ $19.2 \mathrm{~Hz}, \mathrm{H}-2 \mathrm{a}), 3.17\left(1 \mathrm{H}_{\mathrm{b}}, \mathrm{d}, J 19.2 \mathrm{~Hz}, \mathrm{H}-2 \mathrm{~b}\right) \mathrm{ppm}$ in the ${ }^{1} \mathrm{H}$ NMR spectrum. The HRMS of 269 also showed the molecular weight for the $[\mathrm{MH}]^{+}$ion to be 375.14396 , HRMS which confirms that the molecule has undergone the addition of methanol, when compared to HRMS 268 found $[\mathrm{MH}]^{+} 343.11840$ for $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{6}$, where the difference in weight is 36 $\left(\mathrm{CH}_{3} \mathrm{OH}\right)$.

Scheme 46: a. 3M HCl (aq), MeOH, $75{ }^{\circ} \mathrm{C}, 45$ mins, 268 12\%, 269 30\%;

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion Seeing that the microwave assisted Heck reaction of the MOM-protected chalcone 260 was successful we then attempted the same reaction but with the TBDMS protected chalcone 257. Using these Heck reaction conditions, the chalcone 257 was heated in a microwave reactor at $160{ }^{\circ} \mathrm{C}(150 \mathrm{~W})$ for 15 mins , giving a $81 \%$ crude yield of indenone 261 which was then taken without any further purification to be deprotected (Scheme 47).

The indenone 261 was fully characterised with API ES + MS showing a molecular ion $\left[\mathrm{MH}^{+}\right]$ at $m / z 457$, corresponding to a molecular formula of $\mathrm{C}_{25} \mathrm{H}_{33} \mathrm{O}_{6} \mathrm{Si}$. ${ }^{1} \mathrm{H}$ NMR spectroscopy further supported the formation of the indenone 261 with the key indenone diagnostic peak appearing at $\delta 5.71(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2) \mathrm{ppm}$.

Scheme 47: a. $\mathrm{PdCl}_{2}$ (2.5 mol\%), $\mathrm{PPh}_{3}(7.5 \mathrm{~mol} \%), \mathrm{K}_{2} \mathrm{CO}_{3}$, DMF , $\mu$ wave, $160^{\circ} \mathrm{C}(150$ W), 15 mins, crude $81 \%$.

This transformation of $\mathbf{2 5 7}$ into $\mathbf{2 6 1}$ also proved to be capricious. When it was repeated on a slightly larger scale of 160 mg the results varied dramatically from the original reaction. After purification, in this case by column chromatography only a $24 \%$ yield of the TBDMS protected indenone 261 was isolated, however the unprotected indenone 268 was also isolated in a $25 \%$ yield.

The TBDMS-protected indenone 261 was then treated with tetrabutylammonium fluoride (TBAF) in THF at $0^{\circ} \mathrm{C}$ to give the unprotected indenone 268 in a good yield (Scheme 48). The indenone 268 was fully characterised with API ES+ MS showing a molecular ion [ $\mathrm{MH}^{+}$] at $m / z 343$, corresponding to a molecular formula of $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{6}$. ${ }^{1} \mathrm{H}$ NMR spectrum further supported the formation of the indenone 261 with the key indenone diagnostic peak appearing at $\delta 5.73(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2) \mathrm{ppm}$.

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Scheme 48: a. 1 M TBAF in THF, THF, $0^{\circ} \mathrm{C}, 30 \mathrm{mins}, 66 \%$.
A small series of 2 '-bromochalcones 270 - 275 were prepared to make a small library of compounds with the indenone scaffold. They were prepared using the typical ClaisenSchmidt condensation ${ }^{178}$ method previous mentioned and isolated in good yields as crystals after recrystallization from methanol (Scheme 49). The ${ }^{1} \mathrm{H}$ NMR spectra of the compounds showed that they were isolated as the pure $E$ isomer by their alkene coupling value $\approx 15-16$ Hz . The fluoro chalcone $271{ }^{1} \mathrm{H}$ NMR spectrum showed a more complex coupling pattern due to the fluorine hydrogen coupling on its aromatic B ring (Figure 31), with with ${ }^{1} \mathrm{H}$ NMR signals at $6.97\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime \prime}\right), 7.29-7.33(1 \mathrm{H}, \mathrm{dm}, J 9.0 \mathrm{~Hz}, \mathrm{H}-6$ '') and $7.36(1 \mathrm{H}$, dd, $J 2.0 \mathrm{~Hz}, J 12.0$

Hz, H-2'’) ppm.

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

Figure 31: ${ }^{1} \mathrm{H}$ NMR of chalcone 271
To make chalcone 270 the 4-methoxy-3-nitrobenzaldehyde (276) was prepared from $p$ anisaldehyde by nitration with concentrated nitric acid and concentrated sulfuric acid at $-15^{\circ} \mathrm{C}$ (Scheme 50). The benzaldehyde 276 was isolated after an hour by pouring the reaction into ice cold water. The benzaldehyde 276 that precipitated as a light brown solid was then filtered off, recrystallized from ethanol and then dried in vacuo. This benzaldehyde was then used to prepare chalcone 270.

Scheme 50: a. $\mathrm{HNO}_{3}, \mathrm{H}_{2} \mathrm{SO}_{4},-15^{\circ} \mathrm{C}, 1$ hour, $69 \%$.
Each of the 2'-bromochalcones 270 - 275 were then treated with the conditions described by Clark ${ }^{225}$ for the intramolecular Heck reaction, on a 1 mmol scale (Scheme 51, route a). This route worked well for all the chalcones, except for nitro chalcone 270 and dichloro chalcone 275. The indenones 277 - 280 were isolated pure after column chromatography and recrystallization from EtOAc and hexane. The formation of the dichloro indenone 281 was problematic because the reaction did not go to completion and the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude product showed that it was a mixture of the starting chalcone 275 and the indenone 281. Unfortunately both chalcone 275 and indenone 281 were not resolved by TLC, however we did manage to isolate the indenone by recrystallization from ethyl acetate and hexane in a $31 \%$ yield of peach coloured fluffy crystals. The reaction to make the nitro indenone $\mathbf{2 8 2}$ via traditional heating techniques did not work and the starting chalcone was recovered. We next tried the microwave conditions used to make the MOM and TBDMS protected indenone 265

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion and 261 on the chalcone 270 (Scheme 51, route b). The indenone 282 was prepared running the experiment on a 100 mg scale of the chalcone 270 five times and then combining the crude mixtures and working them up together. After recrystallization from ethyl acetate and hexane $\mathbf{2 8 2}$ was isolated as red crystals in a $31 \%$ yield.

Scheme 51: a. $\mathrm{PdCl}_{2}$ ( $2.5 \mathrm{~mol} \%$ ), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}$, $\mathrm{DMF}, 110^{\circ} \mathrm{C}, 30 \mathrm{mins}$, yield (see table 7); b. $\mathrm{PdCl}_{2}$ ( $2.5 \mathrm{~mol} \%$ ), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF, $\mu$ wave, $160{ }^{\circ} \mathrm{C}(150$ W), 15 mins, yield (see table 7).

Table 7: Yields of indenones 277-282 (see scheme 51).

| Indenones | Route | $\mathrm{Ar}^{1}$ | $\%$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{2 7 7}$ | a | 3-Fluoro-4-methoxyphenyl | 70 |
| $\mathbf{2 7 8}$ | a | Phenyl | 65 |
| $\mathbf{2 7 9}$ | a | 3,5-Dimethoxyphenyl | 54 |
| $\mathbf{2 8 0}$ | a | 3,4,5-Trimethoxyphenyl | 63 |
| $\mathbf{2 8 1}$ | a | 3,4-Dichlorophenyl | 32 |
| $\mathbf{2 8 2}$ | b | 3-Nitro-4-methoxyphenyl | 31 |

We then wanted to investigate the effects of replacing the $\alpha$-hydrogen with a methyl on the indenone scaffold, due to the marked improvement of the biological activity of chalcones such as 182 . The 2 '-bromopropiophenone 283 was prepared via the Grignard addition of commercially available ethylmagnesium chloride in THF to the 2-bromobenzaldehyde $\mathbf{2 5 2}$ to make the secondary alcohol 284. This alcohol was oxidized with PCC to give the desired 2'bromo propiophenone 283 in a good yield (Scheme 52).

Scheme 52: a. EtMgCl ( 2 M in THF), THF, $0^{\circ} \mathrm{C}$ to r.t., 12 hours, $99 \%$; b. PCC, DCM, r.t., 12 hours, $89 \%$.

Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion The $\alpha$-methylchalcone 285 was then prepared via the acid-catalyzed condensation method described by Edwards, ${ }^{72}$ by refluxing 2 '-bromopropiophenone 283 and $p$-anisaldehyde in ethanol, glacial acetic acid and piperidine (Scheme 53). The reaction generates water which was removed from the reaction as the refluxing reaction condenses in the condenser tube packed with activated $3-\AA$ molecular sieves. The reaction was then worked up and purified by chromatography. However the desired chalcone was isolated with p-anisaldehyde which co-eluted on the TLC plate. The ${ }^{1} \mathrm{H}$ NMR spectrum showed the ratio of $\alpha$-methylchalcone 285 to $p$-anisaldehyde was 2.9:1. To remove the $p$-anisaldehyde from the desired $\alpha$ methylchalcone 285 the mixture was shaken in deuterated chloroform in the presence of the scavenger agent PS-trisamine (286) at room temperature for 2 hours. PS-trisamine (286) can scavenge a range of compounds ${ }^{231}$ including acid chlorides, aldehydes, epoxides and isocyanates. To scavenge benzaldehydes the primary amine groups of PS-trisamine

286 (286) react with the carbonyl of the benzaldehyde forming imines. Deuterated chloroform was used as the solvent so that the reaction can monitored by taking ${ }^{1} \mathrm{H}$ NMR spectra periodically. After which time the mixture was passed through a filter to remove the PStrisamine to give the pure $\alpha$-methylchalcone 285 as a yellow oil in a fair yield (Scheme 53).

The $\alpha$-methylchalcone 285 was fully characterised with AP+ mass spectrometry showing a molecular ion $\left[\mathrm{MH}^{+}\right]$at $m / z 421$, corresponding to the molecular formula $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{BrO}_{s}$. The ${ }^{1} \mathrm{H}$ NMR spectrum also supports the formation of the $\alpha$-methylchalcone 285 , the key diagnostic peak being the $\beta-\mathrm{H}$ of the enone system appearing at $\delta 7.09(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3) \mathrm{ppm}$. Similar $\alpha-$ methylchalcone $56,{ }^{177,191} 287$ and $\mathbf{2 8 8}^{36}$ prepared previously our group and the $\alpha$ methylchalcone $\mathbf{x 2 3}$ were all isolated as the $E$-isomer with the $\beta$-H appearing $7.08-7.17 \mathrm{ppm}$ (Figure 32). The $\beta-\mathrm{H}$ signal of the $\alpha$-methylchalcone 285 appears at $\delta 7.09 \mathrm{ppm}$ suggesting that the E-isomer of $\mathbf{2 8 5}$ has also been isolated.

Scheme 53: a. Piperidine, AcOH, EtOH, Ar, $110^{\circ} \mathrm{C}, 7$ days; b. PS-trisamine 286, $\mathrm{CHCl}_{3}$, r.t., 2 hours, $61 \%$ over 2 steps.

Figure 32: 'H NMR signals for the $\beta$-H of the $\alpha$-methylchalcone chalcones
The Clark indenone formation technique, ${ }^{225}$ as previously described, was then applied to $\alpha$ methylchalcone 285. Unfortunately this reaction did not work and the $\alpha$-methylchalcone 285 was recovered. The microwave indenone technique was then also tried, this reaction also failed and the starting material was recovered (Scheme 54).

285

289

Scheme 54: a. $\mathrm{PdCl}_{2}$ ( $2.5 \mathrm{~mol} \%$ ), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{DMF}, 110{ }^{\circ} \mathrm{C}, 1$ hour; b. $\mathrm{PdCl}_{2}$ ( $2.5 \mathrm{~mol} \%$ ), $\mathrm{PPh}_{3}$ ( $7.5 \mathrm{~mol} \%$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}$, DMF, $\mu$ wave, $160^{\circ} \mathrm{C}$ ( 150 W ), 15 mins.

One possible reason why the internal Heck reaction of $\alpha$-methylchalcone $\mathbf{2 8 5}$ failed, may be due to the difficulty in forming the carbometallation intermediate 293 (Scheme 55). The carbometallation intermediate of $\alpha$-methylchalcone 285, 295 (Figure 33) has two bulky groups attached to the C-2 position, the methyl group and the palladium (II) species, these will make the formation of this intermediate unfavourable due to steric hindrance of these groups. This is not a problem for the formation for indenones from the 2 '-bromochalcones which only have a hydrogen on the $\alpha$-position instead of a methyl group, because this gives a carbometallation intermediate 296 (Figure 33) has less steric hindrance from the interaction of the hydrogen and the palladium (II) species attached to the C-2 position which makes its formation more favourable than the formation of 295 (Figure 33).

## Chapter 3 - Combretastatin A-4 like chalcones and analogues. Results and Discussion

|  | $\mathrm{IC}_{50}(\mathrm{~K} 562)(\mu \mathrm{M})$ |
| :---: | :---: |
| $\mathbf{2 6 9}$ | 0.024 |

The biological results show that the addition of a bromine on the C 2 position of the A ring of the chalcone generally decreases the biological activity against leukaemia cell line K562, for instance the $\alpha$-methylchalcone $285\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=0.24 \mu \mathrm{M}\right]$ with the bromine on the C 2 position of its A ring is much less effective against K562 than the $\alpha$-methylchalcone 182 $\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=0.010 \mu \mathrm{M}\right]$ without the bromine. The conformationally $s$-trans locked indenones generally show an increased activity against K562 when compared against their 2'bromochalcone precursors. This activity is also an improvement on their conformationally flexible chalcone analogues, for instance the activity of chalcone $165\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=1.6 \mu \mathrm{M}\right]$ is considerably increased when compared to its indenone $256\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=0.090 \mu \mathrm{M}\right]$. As is expected from previous biological results the indenone 268 with the CA-4 like 3-hydroxy-4-methoxyphenyl B ring is the most active indenone prepared [ $\mathrm{IC}_{50}(\mathrm{~K} 562)=0.019 \mu \mathrm{M}$ ] and is a potent inhibitor of K 562 cells. It is a shame that the $\alpha$-methyl indenone $\mathbf{2 8 9}$ could not be prepared because the addition of the methyl group alpha to the carbonyl of chalcones has shown a vast improvement on their biological activity, ${ }^{73}$ and it would be interesting to see if this improvement also takes place on the indenones. The side product 269 from the deprotection of the MOM protected indenone $\mathbf{2 6 5}$ also has a high biological activity against $\mathrm{K} 562\left[\mathrm{IC}_{50}(\mathrm{~K} 562)=0.024 \mu \mathrm{M}\right]$ and further investigation into this product may lead to other compounds of interest, one area specifically that may give interesting results on this compound is the investigation of the separation of the two enantiomers of 269 to see what effects they have on its biological activity.

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

### 4.1 The Development of other Cytotoxic Chalcones ${ }^{232}$

The biological properties of the chalcone scaffold have been widely investigated and have shown a diverse range of pharmacological activities including cytotoxicity, ${ }^{232}$ antitumour, ${ }^{232}$ antiinflammatory, ${ }^{10,233.234}$ antiplasmodial, ${ }^{235}$ and antioxidant ${ }^{236}$ properties. There has been sustained interest in the cytotoxic properties of chalcones and in recent years a number of cytotoxic chalcones have been reported

Nam ${ }^{237,238}$ and co-workers prepared a $50+$ library of $2^{\prime}, 55^{\prime}$-dihydroxychalcones developed from the active extracts of the Vietnamese medicinal plant Notopterygium incisum. ${ }^{239,240}$ These chalcones were then tested against a variety of tumour cell lines including B16 murine melanoma, HCT 116 human colon cancer and A31 human epidermoid carcinoma to investigate there cytotoxicity. The majority of the $2^{\prime}, 5$ '-dihydroxychalcones proved to have potent cytotoxicity against these cell lines, with the 2 -chloro substituted $B$ ring chalcone 297 being one of the most cytotoxic chalcone prepared. Several of the chalcones prepared also had strong angiogenesis inhibitory properties, especially 297 [The $\mathrm{IC}_{50}$ for growth inhibition of human

297 umbilical vein endothelial cells (HUVEC) was $0.11 \mu \mathrm{M}$ ]..$^{237}$

The 2'-oxygenated chalcones have previously shown anticancer activity including the inhibition of the growth of the MCF-7 human breast cancer cells. ${ }^{241}$ Rao and co-workers ${ }^{222}$ decided to synthesis ten 2'-oxygenated chalcones to further investigate their cytotoxic effects against the Jurkat and U937 human tumour cell lines, as well as against normal peripheral blood mononuclear cells (PBMCs), to explore their potential clinical application. The $2^{\prime}$-oxygenated chalcone 298 proved to be selectively toxic to Jurkat cells, $\mathrm{IC}_{50}$ (Jurkat) $3.2 \mu \mathrm{M}$, but showed little cytotoxicity to U937 cancer cells, $\mathrm{IC}_{50}$ (U937) $16.0 \mu \mathrm{M}$ or the normal cells, $\mathrm{IC}_{50}$ (PBMCs) $39.8 \mu \mathrm{M}$. The 2'-oxygenated chalcones 299-301 also showed good cytotoxicity to both Jurkat and U937 cells with $\mathrm{IC}_{50}<7 \mu \mathrm{M}$, however they were all fairly cytotoxic to the normal cell line PBMC as well with $\mathrm{IC}_{50}<11 \mu \mathrm{M}$.

299

300

301

The 2'-amino chalcone analogues of structurally rigid 2-phenyl-4-quinolones ${ }^{243}$ were shown to possess potent cytotoxic activity to a panel of human tumour cells, with the 2 '-amino chalcone $\mathbf{3 0 2}$ being the most potent. ${ }^{244}$ The presence of the $2^{\prime}$-amino group was shown to be

Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion vital to the activity of the chalcone, with $\mathbf{3 0 3}$ being 40 fold less active than the $2^{\prime}$-amino chalcone 302 .

Dimmock et al. ${ }^{224}$ investigated the cytotoxicity of various Mannich
 base chalcones, many of which displayed a significant cytotoxicity towards murine P388, L1210 leukaemia cells and a number of human tumour cells as well. The idea that caused these Mannich
 base chalcones to be investigated for possible cytotoxicity is that a number of $\alpha, \beta$-unsaturated ketones have demonstrated reactivity towards soft nucleophiles like thiols ${ }^{245,246}$ instead of hard nucleophiles like hydroxy or amino groups, and therefore avoid the problems of mutagenicity and carcinogenicity associated with a number of alkylating agents used in cancer chemotherapy. ${ }^{247}$ The Mannich base should also be able to alkylate the thiol as well, causing the compound to be more cytotoxic than the normal chalcone (Scheme 57). The chalcone 304 may alkylate the common cellular thiol glutathione (GSH, 305) to give the adduct 306 (Scheme 56). This could also happen to the Mannich base
 chalcone 307 to give the thiol adduct 308, the Mannich base of 308 could then form the intermediate enone 309 which could then undergo further thiol alkylation to give the thiol bisadduct 310 (Scheme 57).

Scheme 56: The mechanism of the thiol alkylation of chalcone 304

Scheme 57: The mechanism of thiol alkylation of Mannich base chalcone 307

Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion Biological testing of the Mannich base chalcone 311 showed that in a buffered solution it was stable and it did not react with the excess GSH (305). However the chalcone 311 did react with GSH (305) when it was in the presence of glutathione $S$-transferase. Therefore under these biological conditions the chalcones may undergo thiol alkylation. ${ }^{224}$

The most promising lead molecule found in Dimmock study was

 the Mannich base chalcone 312 which displayed potent cytotoxicity to the L1210 [ $\left.\mathrm{IC}_{50}(\mathrm{~L} 1210) 2.5 \mu \mathrm{M}\right]$ and human tumour cells[ $\mathrm{IC}_{50}($ Molt $4 / \mathrm{C} 8) 7.0 \mu \mathrm{M}, \mathrm{IC}_{50}(\mathrm{CEM}) 2.5$ $\mu \mathrm{M}] .{ }^{224}$

The 4', $4^{\prime \prime}$-hydroxychalcone RVC-588 (313) has also been shown recently to be cytotoxic to the human myeloid HL-60 leukaemia cell line $\left(\mathrm{IC}_{50} 2 \mu \mathrm{M}\right)$. ${ }^{248}$ The mode of action of $\mathbf{3 1 3}$ is not known, however a previous study ${ }^{236}$ has shown that hydroxy substituted compounds were found to be the most potent antioxidant and cytotoxic in tumour cells, and it may be the hydroxy
 groups that play a role in the cytotoxicity of RVC-588 (313). It was also proposed that the cytotoxicity of RVC-588 (313) could be attributed in part to the thiol alkylating ability of the $\alpha, \beta$-unsaturated carbonyl system in the chalcone. ${ }^{224}$

Hexane extracts of the common northeastern Brazilian plant Lonchocarpus sericeus, were found to be cytotoxic against the CEM leukemic cell line, $\mathrm{IC}_{50} 17.6 \mu \mathrm{gmL}^{-1} .{ }^{249}$ The main components of the extract were Lonchocapin (314) [ $\mathrm{IC}_{50}$ (CEM) $33.9 \mu \mathrm{M}$ ] and Derricin (315) [ $\mathrm{IC}_{50}(\mathrm{CEM}) 40.3 \mu \mathrm{M}$ ] in roughly equal amounts. Derricin (315) proved to be the most potent of the two chalcone isolated causing a maximum inhibition of CEM

314
 cells of $96 \%$, while Lonchocapin (314) maximum inhibition of the CEM cells was $77 \%$. Further testing of the prenylated chalcone Derricin (315) showed that it disrupted the development of fertilized eggs of sea urchins by disrupting the cell cycle. Further testing suggested that the cytotoxicity of the two chalcones 314 and 315 was not due to microtubule disruption. ${ }^{249}$

Two similar chalcones have been recently isolated from the Japanese plant Angelica keiskei Koizumi, xanthoangelol (316) ${ }^{250}$ and 4-hydroxyderricin (317). ${ }^{251}$ Xanthoangelol (316) ${ }^{250}$ and 4-hydroxyderricin (317) ${ }^{251}$ were both shown to inhibit the growth of Lewis lung carcinoma (LLC) tumours and have antimetastatic properties. It was proposed that the mechanism for

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

the antitumour and antimetastatic actions of $\mathbf{3 1 6}$ might involve the inhibition of DNA synthesis in LLC cells and inhibition of tumour induced angiogenesis. ${ }^{250}$ However it was found that 317 did not inhibit DNA synthesis and its mechanism of antitumour and antimetastatic actives of 317 may be associated with the inhibition of the reduction of the immune system and tumour-induced angiogenesis. ${ }^{251}$

The human homolog of MDM2 (mouse double minute 2) oncogene is over expressed in human breast cancer, and it binds to the tumour suppressor protein p53 at its transactivation site, inhibiting p53's ability to initiate apoptosis and leading to deregulation of the cell cycle. This makes disruption of the p53/HDM2 complex an attractive target for cancer therapy. Stoll ${ }^{252}$ and co workers found that chalcones with carboxylic acid substituents bound to the tryptophan pocket of the p53 binding site of MDM2 and promote dissociation of the p53/MDM2 complex. The most active carboxylic acid chalcone 318 inhibited MDM2 binding to p 53 with an $\mathrm{IC}_{50}$ value of $49 \mu \mathrm{M}$. The carboxylic acid chalcone 318 was shown by multidimensional NMR spectroscopy to dock in the
 tryptophan subsite of human MDM2 p53 binding site and disrupt the MDM2/p53 protein complex. The carboxylic acid is thought to be important to the activity of $\mathbf{3 1 8}$ by disrupting the salt bridge between lysine 51 and glutamic acid 54 in the tryptophan subsite of human MDM2 bound P53.

The replacement of the carboxylic acid group with a boronic acid was further investigated by Kumar et al. ${ }^{253}$ The boronic acids are weaker acids $\mathrm{pK}_{\mathrm{a}} 9-10$ and will be largely non-ionized at physiological pH and are therefore unlikely to form a salt bridge with lysine51. However it was proposed that they may form a covalent bond to the amino of lysine51 instead, resulting in a stronger interaction with p53 binding site of MDM2. The carboxylic acid chalcone 318 was not selectively toxic to cancer cell lines, with $\mathrm{IC}_{50}$ values ranging from
 $13-18 \mu \mathrm{M}$ for the human breast cancer cell lines and $\mathrm{IC}_{50}$ values ranging from $12-28 \mu \mathrm{M}$ for the normal human breast cell lines, however the boronic acid chalcones showed a greater selectivity to cancer cells. For example the iodo derivative boronic acid $\mathbf{3 1 9}$ had the highest selective cytotoxicity against human breast cancer cell lines $\mathrm{IC}_{50} 9.5-18 \mu \mathrm{M}$, compared to the normal human breast cell line $\mathrm{IC}_{50} 38-100 \mu \mathrm{M} .{ }^{253}$

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

### 4.2 The total synthesis of 4-hydroxyderricin (317) and analogues.

The hardy Japanese plant Angelica keiskei Koizumi (Japanese name "Ashitaba", belonging to the Umbelliferae family) is found mainly on the Pacific coast of Japan. The Umbellifers are used in traditional Chinese medicines, ${ }^{254}$ Angelica keiskei Koizumi has traditionally been used as a diuretic, laxative, analeptic and galactagogue. ${ }^{255}$ The plant has also shown beneficial effects such as the suppression of gastric acid secretion, ${ }^{256}$ antithrombotic effects, ${ }^{257}$ reduction of blood pressure, ${ }^{258}$ suppression of histamine release and the promotion of blood circulation. ${ }^{259}$ The roots and herbs of $A$. keiskei are also thought to have preventive effects against coronary heart disease, hypertension and cancer, however the basis for this is unclear. ${ }^{250,251}$

In a study of the anti-tumour-promoting activities of the Umbelliferae family, Okuyama ${ }^{254}$ and co-workers reported the potent anti-tumour activity of the nonpolar extracts of the root of Angelica keiskei. Eight compounds were isolated from the nonpolar extract including three chalcones xanthoangelol (316), 4-hydroxyderricin (317) and the novel ashitaba-chalcone (320). The chalcones xanthoangelol (316) and 4-hydroxyderricin (317) proved to have antitumour promoting activity in mouse skin carcinogenesis that had been induced by exposure to the carcinogen 7,12-dimethylbenz[ $\alpha$ ]anthracene (DMBA, 321) plus 12-O-tetradecanoyl phorbol-13-acetate (TPA, 322). ${ }^{254}$

Akihisa ${ }^{260}$ and co-workers have recently reported the isolation of seventeen different compounds from the ethyl acetate extract of the stems of Angelica keiskei including two of the previously reported chalcones 316 and 317 , as well as three other chalcones xanthoangelol F (323), xanthoangelol H (324), isobavachalcone (325). All 5 of the chalcones isolated showed potent antitumour inhibition of the induction of Epstein-Barr virus early antigen (EBV-EA) by TPA (322), with the chalcones 317 and 325 being the most potent inhibitors. ${ }^{260}$

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

In another recent study by Kimura and co-workers the two chalcones xanthoangelol (316) ${ }^{250}$ and 4-hydroxyderricin (317) ${ }^{251}$ were isolated from Angelica keiskei. Both of the chalcones 316 and 317 were shown to inhibit the growth of Lewis lung carcinoma (LLC) tumours, and were also reported to have antimetastatic properties. It was proposed that the mechanism for the antitumour and antimetastatic actions of 316 might involve the inhibition of DNA synthesis in LLC cells and inhibition of tumour induced angiogenesis. ${ }^{250}$ However when 4hydroxyderricin (317) was further investigated it did not inhibit DNA synthesis. The mechanism of antitumour and antimetastatic actives of 317 are now proposed to be associated with the inhibition of the reduction of the immune system and tumour-induced angiogenesis. ${ }^{251}$ The chalcone 4-hydroxyderricin (317) has been shown to exert a beneficial effect on the prevention of strokes in mice. ${ }^{261}$

So we have chosen to further investigate the total synthesis of 4-hydroxyderricin (317) and then create a small library of similar compounds to assess their biological activity.

### 4.2.1 The synthesis of 4-hydroxyderricin (317).

Our idea for the synthesis of 4-hydroxyderricin (317) was the preparation of the 3'allylacetophenone 326 from 2-hydroxy-4-methoxyacetophenone (327), followed by the Claisen-Schmidt condensation ${ }^{178}$ with 4 '-hydroxybenzaldehyde (328) to give the 3 'allylchalcone 329. Metathesis of the 3 '-allylchalcone 329 would then hopefully provide the prenylated chalcone 4-hydroxyderricin (317) (Scheme 58).

Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

327

326

328

Scheme 58
Using the method described by Anjaneyulu ${ }^{262}$ et al., the hydroxy group of $2^{\prime}$-hydroxy-4'methoxyacetophenone (327) was allylated by refluxing 327 in acetone with allyl bromide and potassium carbonate at $75^{\circ} \mathrm{C}$ for 12 hours (Scheme 59). The mixture was then allowed to cool to room temperature, the potassium carbonate was then removed by filtration and then the acetone was removed in vacuo. The crude product was then dissolved in ethyl acetate and the base washed with $5 \%$ sodium hydroxide solution to remove any remaining 327, the allyl ether acetophenone 330 was then isolated in an excellent yield as a white solid.

The allyl ether acetophenone 330 was then dissolved in $N, N$-dimethylaniline, and heated at $210{ }^{\circ} \mathrm{C}$ for 12 hours to cause the allyl group to undergo a [3,3]-sigmatropic Claisen rearrangement to give the 3 '-allylacetophenone 326 (Scheme 59) ${ }^{262}$ as yellow crystals in a moderate yield.

Scheme 59: a. allyl bromide, $\mathrm{K}_{2} \mathrm{CO}_{3}$, acetone, $75^{\circ} \mathrm{C}, 12$ hours, $99 \%$; b. $N, N$-dimethyl aniline, $210^{\circ} \mathrm{C}$, 6 hours, $32658 \%$; c. $N, N$-dimethylaniline, $\mu$ wave, $260^{\circ} \mathrm{C}, 200 \mathrm{~W}, 12$ mins, 326 66\%.

The key diagnostic peaks of the ${ }^{1} \mathrm{H}$ NMR spectrum of 3 '-allylacetophenone 326 are the peaks for the allyl group which appear at $3.42\left(2 \mathrm{H}, \mathrm{dt}, J 6.1,1.7 \mathrm{~Hz}, \mathrm{H}-1{ }^{\prime \prime}\right), 4.93-4.98$ ( $1 \mathrm{H}, \mathrm{dm}, J 10.1 \mathrm{~Hz}$, cis-H-3''), 4.97 - $5.04(1 \mathrm{H}, \mathrm{dm}, J 17.0 \mathrm{~Hz}$, trans-H-3'’) and $5.95(1 \mathrm{H}$,

Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion
ddt, $J 10.1,17.0$ and $6.1 \mathrm{~Hz}, \mathrm{H}-2^{\prime \prime}$ ) ppm (Figure 34). The ${ }^{1} \mathrm{H}$ NMR spectrum of 326 corresponds to the literature values reported by Anjaneyulu ${ }^{262}$ et al.

Figure 34: ${ }^{1} \mathrm{H}$ NMR spectra signals for the allyl group of 326
The Claisen rearrangement of the allyl ether acetophenone $\mathbf{3 3 0}$ to prepare the 3 '-allyl acetophenone 326 (Scheme 59) was tried again. However instead of heating this reaction conventionally we used the microwave reactor to see if we could reduce the reaction time. It is generally expected that each time the temperature of a reaction is increased in the microwave reactor by $10^{\circ} \mathrm{C}$ the time taken for the reaction is halved. Therefore the Claisen rearrangement was attempted at $260^{\circ} \mathrm{C}$ for 12 minutes, after which time the TLC showed that the reaction had gone to completion (Scheme 59, route c). The 3'-allyl acetophenone 326 was then isolated by column chromatography as a yellow solid in a moderate yield.

The 2'-hydroxy group of $\mathbf{3 2 6}$ had to be protected before the acetophenone $\mathbf{3 2 6}$ could be used to prepare a chalcone, to prevent the in situ formation of the possible flavanone side product from the $2^{\prime}$-hydroxychalcone under the basic conditions needed for the Claisen-Schmidt condensation. ${ }^{232}$

We first attempted the MOM protection of $\mathbf{3 2 6}$ using the conditions that had previous worked for protecting isovanillin in chapter $3 .{ }^{228}$ A solution of $\mathbf{3 2 6}$ in DMF was treated with 1.2 equivalents of sodium hydride, followed by 1.2 equivalents of methoxymethyl chloride. This technique for MOM protection did not work well and only gave a low yield of $28 \%$ of 331 , and $70 \%$ of the starting acetophenone 326 (Scheme 60).

We then tried using a modified version of the MOM protecting strategy described recently by Romano ${ }^{263}$ and coworkers for the protection of 2,4-dihydroxybenzaldehyde. In this protocol a

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

slightly larger excess of sodium hydride and MOMCl is used. But the significant change is the reaction temperature ( $65^{\circ} \mathrm{C}$ for 18 hours). The MOM protected acetophenone 331 was isolated after column chromatography in a moderate yield of $43 \%$. The starting acetophenone 326 was also recovered from the column chromatography in a $42 \%$ yield (Scheme 60).

Scheme 60: a. MOMCl ( 1.2 eqv), NaH ( 1.2 eqv), DMF, $0{ }^{\circ} \mathrm{C}$ to r.t., $12 \mathrm{hrs}, 28 \%$; b. $\mathrm{MOMCl}\left(1.5\right.$ eqv), NaH ( 1.5 eqv), THF, $0^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}, 18 \mathrm{hrs}, 43 \%$.

Before the chalcone 329 could be made the 4-hydroxybenzaldehyde 328 had to be protected because of the electron-donating effect of the hydroxy group (deprotonated under the reaction conditions) significantly reduces the electrophilicity of the carbonyl group. Therefore we MOM protected the 4-hydroxybenzaldehyde 328 using the conditions described for the MOM protection of isovanillin in chapter 3 (Scheme 61). This gave the MOM protected benzaldehyde 332 in a high yield of $94 \%$ as a pale yellow oil.

Scheme 61: a. MOMCl, NaH, DMF, $0^{\circ} \mathrm{C}$ to r.t., $12 \mathrm{hrs}, 94 \%$.
The MOM protected acetophenone 331 was then treated sodium hydroxide and the benzaldehydes 332 and 333 using the typical Claisen-Schmidt condensation ${ }^{178}$ conditions to give the MOM protected chalcones 334 and 335 . The ${ }^{1} \mathrm{H}$ NMR spectrum of crude products of $\mathbf{3 3 4}$ and $\mathbf{3 3 5}$ showed that they were a mixture of the desired chalcone and their precursor benzaldehyde. Neither of the chalcones were isolated and instead they were deprotected, by refluxing the mixtures in methanol in the presence of 3 M hydrochloric acid for 45 minutes (Scheme 62). ${ }^{230}$ The two chalcones 329 and 336 were then both isolated after column chromatography in good yields. Both chalcones were isolated as their $E$ isomer and were fully characterised.

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Scheme 62: a. $2 \mathrm{M} \mathrm{NaOH}(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight; b. $3 \mathrm{M} \mathrm{HCl}(\mathrm{aq}), \mathrm{MeOH}, 75^{\circ} \mathrm{C}, 45$ mins, 329 81\%, 336 72\%.

The API ES+ mass spectrometry of 3'-allylchalcone 329 showed the expected molecular ion $\left[\mathrm{MH}^{+}\right]$at $m / z$ 311. The key diagnostic peaks in the ${ }^{1} \mathrm{H}$ NMR spectrum of 329 were the hydrogen signals of the enone system appearing at $\delta 7.47(1 \mathrm{H}, \mathrm{d}, J 15.0 \mathrm{~Hz}, \mathrm{H}-2)$ and 7.84 $(1 \mathrm{H}, \mathrm{d}, J 15.0 \mathrm{~Hz}, \mathrm{H}-3) \mathrm{ppm}$ proving that the chalcone 329 was isolated as its $E$-isomer. The hydrogen signals for the allyl group which appear at $3.45\left(2 \mathrm{H}, \mathrm{dt}, J 6.2\right.$ and $\left.1.8 \mathrm{~Hz}, \mathrm{H}-1{ }^{\prime}{ }^{\prime \prime}\right)$, 4.95 - 5.00 ( $1 \mathrm{H}, \mathrm{dm}, J 10.0 \mathrm{~Hz}$, cis-H-3'’’), $5.00-5.07$ ( $1 \mathrm{H}, \mathrm{dm}, J 17.1 \mathrm{~Hz}$, trans-H-3'’’), 5.98 ( 1 H , ddt, $J 10.0 \mathrm{~Hz}, 17.1,6.2 \mathrm{~Hz}, \mathrm{H}-{ }^{\prime}{ }^{\prime}$ ') ppm (Figure 35 ).

Figure 35: ${ }^{1} \mathrm{H}$ NMR spectrum of 3'-allylchalcone 329

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Olefin metathesis is a powerful method of making carbon-carbon double bonds ${ }^{264-266}$ and its use in small molecule synthesis has become widely used in recent years due to the commercial availability of the Schrock catalyst (337) ${ }^{267-269}$ and Grubbs first generation catalyst (338), ${ }^{270-272}$ especially in ring-closing metathesis reactions. The development of Grubbs second generation catalyst (339) ${ }^{273,274}$ has led to the development of new intermolecular olefin cross-metathesis techniques. ${ }^{275-278}$ The cross-metathesis of 2-methyl-2-butene (340) with allyl groups to give prenyl groups has recently been reported (Scheme 63). ${ }^{276.279}$

Scheme 63: a. 2-methylbut-2-ene (340), 339 ( $1 \mathrm{~mol} \%$ ), $23{ }^{\circ} \mathrm{C}, 12 \mathrm{hrs}, 99 \%{ }^{2}{ }^{276}$ b. $2-$ methylbut-2-ene (340), 339 ( $5 \mathrm{~mol} \%$ ), DCM, $50^{\circ} \mathrm{C}, 12 \mathrm{hrs}, 100 \% .{ }^{279}$

The proposed 2-methyl-2-butene (340) cross-metathesis reaction pathway is shown in scheme 64. ${ }^{276}$ The reaction pathway is driven forward by the synthesis of volatile propene (345) which will boil off and be removed from the reaction mixture (Scheme 64).

Scheme 64: 2-methyl-2-butene (340) cross-metathesis reaction pathway ${ }^{276}$

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Using Grubbs second generation catalyst (339) the cross metathesis of the 3 '-allylchalcone 329 and 2-methylbut-2-ene (340) was carried out in anhydrous DCM under an argon atmosphere in a Schlenk tube at $50^{\circ} \mathrm{C}$ for 12 hours. ${ }^{279}$ After column chromatography the 3 'prenylchalcone 4-hydroxyderricin (317) was isolated in a $66 \%$ yield as a yellow solid (Scheme 65).

Scheme 65: a. 2-methylbut-2-ene (340), 339 ( $2 \mathrm{~mol} \%$ ), $\mathrm{DCM}, 50^{\circ} \mathrm{C}, 12 \mathrm{hrs}, 66 \%$.
The 3'-prenylchalcone 317 was characterised and deemed to be identical to the 4-hydroxyderricin (317) isolated by Baba et al ${ }^{80}$ and Okuyama et al ${ }^{54}$ from the plant Angelica keiskei Koizumi. The melting point of $\mathbf{3 1 7}$ was recorded

317 at $133-134{ }^{\circ} \mathrm{C}$ (literature m.p. $134-135{ }^{\circ} \mathrm{C}^{254}$ ) and the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Table 8) of 317 support the formation of 4-hydroxyderricin (317). The key diagnostic peaks in the ${ }^{1} \mathrm{H}$ NMR spectrum of 317 are the hydrogen signals of the enone system appearing at $\delta 7.47(1 \mathrm{H}$, d, $J 15.4 \mathrm{~Hz}, \mathrm{H}-2)$ and $7.83(1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-3) \mathrm{ppm}$ proving that the chalcone 317 was isolated as its $E$-isomer (Figure 36). The hydrogen signals for the prenyl group which appear at $1.68\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-5^{\prime \prime}\right), 1.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-4{ }^{\prime \prime \prime}\right), 3.36\left(2 \mathrm{H}\right.$, broad d, $\left.J 6.5 \mathrm{~Hz}, \mathrm{H}-1{ }^{\prime}{ }^{\prime \prime}\right), 5.23(1 \mathrm{H}$, broad $\mathrm{t}, J 6.5 \mathrm{~Hz}, \mathrm{H}-2^{\prime \prime}$ ') ppm, showing that the 2-methylbut-2-ene (340) cross-metathesis reaction gave the desired prenylated product (Figure 36).

Figure 36: ${ }^{1} \mathrm{H}$ NMR spectrum of 4-hydroxyderricin (317)

We then decided to make a small library of similar 3'-allychalcones and 3'-prenylchalcones. We methylated the 2 '-hydroxy group on the acetophenone 326 to make the synthesis of the chalcone library easier by eliminating the requirement of protecting and deprotecting this hydroxy group. The 2'-hydroxy group was methylated by treating 326 in THF with sodium hydride at $0^{\circ} \mathrm{C}$ under an argon atmosphere and then adding 1 M solution of dimethyl sulfate in THF and then refluxing the mixture for 18 hours at $65^{\circ} \mathrm{C}$ (Scheme 66 ). ${ }^{263}$ This gave the methylated acetophenone 346 which was isolated by column chromatography in an excellent yield as a yellow oil. The ${ }^{1} \mathrm{H}$ NMR spectrum of 346 showed that the 2 -hydroxy group of the acetophenone 326 had been methylated by the presence of a new methoxy signal at 3.75 ppm , and the signal for the 2 '-hydroxy group which appears at 12.77 ppm in the ${ }^{1} \mathrm{H}$ NMR spectrum of 326 was no longer present. The acetophenome 346 was then subjected to the crossmetathesis reaction ${ }^{279}$ with 2-methylbut-2-ene (340) to give the prenylated acetophenone 347 which was isolated in an excellent yield as a light brown oil after column chromatography (Scheme 66).

Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Scheme 66: a. $1 \mathrm{M}(\mathrm{MeO})_{2} \mathrm{SO}_{2}$ in THF, $\mathrm{NaH}, \mathrm{THF}, 0^{\circ} \mathrm{C}$ to $65{ }^{\circ} \mathrm{C}, 18 \mathrm{hrs}, 96 \%$; b. 2-methylbut-2-ene (340), 339 ( $2 \mathrm{~mol} \%$ ), DCM, $50^{\circ} \mathrm{C}$, $12 \mathrm{hrs}, 98 \%$.

A small library of chalcones 348 - $\mathbf{3 6 3}$, were then prepared from the two acetophenones 346 and 347 and various substituted benzaldehydes using the Claisen-Schmidt condensation ${ }^{178}$ conditions (Scheme 67). The chalcones $350-352$ and 358 were purified by recrystallization from methanol, while the other chalcones were purified by column chromatography. All of the chalcones were isolated as the $E$-isomer as shown by their ${ }^{1} \mathrm{H}$ NMR spectra.

Before the chalcones 354 and 362 could be prepared the 4 -hydroxy group of vanillin (364) had to be protected, otherwise the electrophilicity of the carbonyl group of 364 would have

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

been significantly reduced by the electron-donating effects of the 4 -hydroxy group (deprotonated under the reaction conditions). The MOM protected benzaldehyde 365 was prepared from vanillin (364) using the same conditions as previously described for 264 and 332 (Scheme 68). ${ }^{228}$ This gave the MOM protected benzaldehyde 365 as a pale yellow oil which was isolated in a $80 \%$ yield after column chromatography.

Scheme 68: a. MOMCl, NaH, DMF, $0^{\circ} \mathrm{C}$ to r.t., $12 \mathrm{hrs}, 80 \%$; b. $2 \mathrm{M} \mathrm{NaOH}(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight, 354 89\%, $36285 \%$.

From the column of the isolation of the $3^{\prime}$-allylchalcone $\mathbf{3 5 5}$ a side product was also isolated. The side product was a yellow solid which had a melting point of $105-107^{\circ} \mathrm{C}$, the ${ }^{1} \mathrm{H}$ NMR spectrum showed the presence of the MOM protected B-ring of the chalcone 355 with the signals at $3.56\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.30\left(2 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{2} \mathrm{O}\right), 6.92(1 \mathrm{H}, \mathrm{d}, J$ $8.4 \mathrm{~Hz}, \mathrm{H}-5$ '), 7.27 ( $1 \mathrm{H}, \mathrm{dd}, J 1.9 \mathrm{~Hz}, J 8.4 \mathrm{~Hz}, \mathrm{H}-6$ '), 7.47 ( $1 \mathrm{H}, \mathrm{d}, J 1.9 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ) ppm. The ${ }^{1} \mathrm{H}$ NMR spectrum also showed the presence of an $E$-isomer enone system with signals at $6.95(1 \mathrm{H}, J 15.8 \mathrm{~Hz}, \mathrm{H}-2)$ and $7.67(1 \mathrm{H}, J 15.8 \mathrm{~Hz}, \mathrm{H}-3) \mathrm{ppm}$. The ${ }^{13} \mathrm{C}$ NMR spectrum of the side product showed the presence of 12 non-equivalent carbons, with the presence of a carbonyl signal at 188.92 (s, C-1) ppm. Finally the API-ES+ mass spectrometry of the side product gave a molecular ion $\left[\mathrm{MH}^{+}\right]$at $m / z 415$, corresponding to the molecular formula $\mathrm{C}_{23} \mathrm{H}_{27} \mathrm{O}_{7}$. We therefore decided that the side product must be 366 , therefore the reaction mixture must have been contaminated with acetone, which had most probably been used to clean the reaction flask before hand. So that the acetone and benzaldehyde undergo ClaisenSchmidt condensation to give 366 (Scheme 69).

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

$\downarrow$ a

Scheme 69: a. $2 \mathrm{M} \mathrm{NaOH}(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight, $35573 \%, 366$ 17\%.
The 6 MOM protected chalcones 353 - 355 and 361 - 363 were then deprotected by refluxing the chalcones in methanol and in the presence of 3 M hydrochloric acid for 45 minutes (Scheme 70). ${ }^{230}$ The chalcones 367 - $\mathbf{3 7 0}$ were isolated by column chromatography in excellent yields, and the chalcones 371 and 372 were crystallized from methanol.

Scheme 70: a. $3 \mathrm{M} \mathrm{HCl}(\mathrm{aq}), \mathrm{MeOH}, 75^{\circ} \mathrm{C}, 45$ mins, $\mathbf{3 6 7} 95 \%, \mathbf{3 6 8} 99 \%, \mathbf{3 6 9} 98 \%, \mathbf{3 7 0}$ 89\%, 371 72\%, 372 59\%.

We also prepared the $2^{\prime}$-hydroxychalcone $\mathbf{3 7 3}$ without the $3^{\prime}$-allyl or $3^{\prime}$-prenyl group to test for biological activity, because several 2 '-hydroxychalcones have been reported in the literature as being cytotoxic agents ${ }^{241,242}$ and we wanted to investigate the importance of the allyl/prenyl group. The 2 '-hydroxy group of the acetophenone 327 was MOM protected by

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

 treating it with sodium hydride and MOMCl in THF at $65^{\circ} \mathrm{C}$ for 18 hrs . This gave 374 as a pale yellow oil in a moderate yield after chromatography (Scheme 71). ${ }^{263}$ The MOM protected acetophenone 374 and MOM protected benzaldehyde 332 were then treated with aqueous sodium hydroxide in the typical Claisen-Schmidt condensation ${ }^{178}$ conditions, yielding the MOM protected chalcone 375 as a yellow oil which was isolated via column chromatography (Scheme 71). The MOM protected chalcone 375 was then deprotected by refluxing it in methanol and 3 molar hydrochloric acid for 45 minutes (Scheme 71). This MOM deprotection led to 2 separate products which were isolated by chromatography, the first being the desired 2 '-hydroxychalcone 373 in a moderate yield as a yellow solid and the flavanone side product 376 as yellow crystals. The 2 '-hydroxychalcone 373 was isolated as the $E$-isomer as which was shown in the ${ }^{1} \mathrm{H}$ NMR spectrum by its alkene coupling of 15.4 Hz . The ${ }^{1} \mathrm{H}$ NMR spectrum of the flavanone 376 corresponds to literature values given by Pouget et al, ${ }^{281}$ with the key signals in the spectrum being the signals for the classic ABX system of the flavanone 376 which appear at $2.81\left(1 \mathrm{H}_{\mathrm{a}}, \mathrm{dd}, J 2.9 \mathrm{~Hz}, J 16.9 \mathrm{~Hz}, \mathrm{H}-3 \mathrm{a}\right), 3.06$ $\left(1 \mathrm{H}_{\mathrm{b}}, \mathrm{dd}, J 13.2 \mathrm{~Hz}, J 16.9 \mathrm{~Hz}, \mathrm{H}-3 \mathrm{~b}\right)$ and $5.41\left(1 \mathrm{H}_{\mathrm{x}}, \mathrm{dd}, J 2.9 \mathrm{~Hz}, J 13.2 \mathrm{~Hz}, \mathrm{H}-2\right) \mathrm{ppm}$.

Scheme 71: a. MOMCl, NaH, THF, $0^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}, 18 \mathrm{hrs}, 66 \%$; b. 332, 2 M NaOH (aq), MeOH , r.t., overnight $62 \%$; c. $3 \mathrm{M} \mathrm{HCl}(\mathrm{aq}), \mathrm{MeOH}, 75^{\circ} \mathrm{C}, 45 \mathrm{mins}, 37341 \%, 37634 \%$.

366 IC $_{50}(\mathrm{~K} 562) 3.9 \mu \mathrm{M}$

$373 \mathrm{IC}_{50}(\mathrm{~K} 562)>10 \mu \mathrm{M}$

375 IC $_{50}($ K562 $)>10 \mu \mathrm{M}$

$376 \mathrm{IC}_{50}(\mathrm{~K} 562)>10 \mu \mathrm{M}$

The 4-hydroxyderricin (317) and chalcone derivatives generally show low cytotoxicity towards the human leukaemia cell line K562. Only 7 of the compounds prepared show cytotoxicity below $10 \mu \mathrm{M}$.

The most active of these compounds is the chalcone $(E)$-1-(3-allyl-2,4-dimethoxyphenyl)-3-(3-hydroxy-4-methoxyphenyl)prop-2-en-1-one (369) which displays an $\mathrm{IC}_{50}$ value of $0.2 \mu \mathrm{M}$. Our studies of the CA-4 like chalcones (see chapter 3) have shown that chalcones which bear the 3 -hydroxy-4-methoxyphenyl $B$-ring display potent cytotoxicity towards the K 562 cell line and the activity of $\mathbf{3 6 9}$ may be due to presence of its 3-hydroxy-4-methoxyphenyl $B$ ring.

The prenylated version of 369, (E)-3-(3-hydroxy-4-methoxyphenyl)-1-(2,4-dimethoxy-3-(3-methylbut-2-enyl)phenyl)prop-2-en-1-one (372) has an $\mathrm{IC}_{50}$ value of $8.4 \mu \mathrm{M}$, shows that the

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

addition of the two methyl groups on the allyl group to make the prenyl group cause a 40 fold decrease in activity of this chalcone.

The side product ( $1 E, 4 E$ )-1,5-bis(4-methoxy-3-(methoxymethoxy)phenyl)penta-1,4-dien-3one (366) is the second most active compound isolated, with an $\mathrm{IC}_{50}$ value of $3.9 \mu \mathrm{M}$. The deprotected version of this compound may have been proven to be more active, and may prove interesting for future studies. Several similar compounds have been reported by Artico and co-workers ${ }^{282}$ for having anti-HIV activity.

## 4.3 p53-MDM2 complex disrupting chalcones ${ }^{283,284}$

The tumour suppressor p53 is a key player in the prevention of cancer. When a cell is exposed to oncogenic stress, p53 in the cell nucleus acts as a transcription factor capable of activating multiple target genes, leading to cell cycle arrest, apoptosis and senescence as well as enhancing DNA repair. ${ }^{285-287}$ Therefore p53 ensures that cells carrying cancer promoting alterations such as damaged genomes are either fixed or permanently deleted. In normal cells the p53 is tightly regulated by the oncoprotein HDM2, which binds to p53 and promotes p53 ubiquitination, causing the degradation of p 53 within the nucleus and prevents it causing cell death in normal cells. ${ }^{288}$ However amplification of the HDM2 protein has been observed in several human tumours, ${ }^{283.289-292}$ inhibiting the ability of p53 to initiate apoptosis of cancer cells. This makes disruption of the $\mathrm{p} 53 / \mathrm{HDM} 2$ complex an attractive target for cancer therapy.

However due to the nature of proteins-protein interactions, with their relatively large and flat interacting surfaces they are often viewed as high-risk targets because they are not easily disrupted by small drug like molecules. ${ }^{293}$ The crystal structure of a p53 bound to HDM2 revealed that the interaction of the two proteins is due to the projection of three amino acid residues (Phenylalanine 19, Tryptophan23 and Leucine26) from p53 into the deep hydrophobic binding pocket on the surface of MDM2 (Figure 37). ${ }^{294}$ This realization has raised the hope that finding a pharmacological inhibitor of this interaction may be possible.

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Phenylalanine 19
Tryptophan23
Leucine26

Figure 37: The p53 helix binding to the hydrophobic binding pocket on the surface of MDM2. ${ }^{294}$

Stoll et al. ${ }^{252}$ reported chalcones are HDM2 antagonists. They found that chalcones with carboxylic acid substituents could disrupt the MDM2 binding of p53 with ELISA (EnzymeLinked Immunosorbent Assay) data giving IC $_{50}$ values of $49-250 \mu \mathrm{M}$ for the disruption of p53/HDM2 complex (Figure 38).

$318 \mathrm{IC}_{50} 49 \mu \mathrm{M}$

$379 \mathrm{IC}_{50} 117 \mu \mathrm{M}$

378 IC $_{50} 250 \mu \mathrm{M}$

Figure 38: Inhibition of MDM2 binding to p53 measured by ELISA ${ }^{252}$
The chalcones were then tested to see if they could dissociate preincubated p53/MDM2 complexes and release p53 active for DNA-binding in a electrophoretic gel mobility shift assay (EMSA). The EMSA showed that the carboxylated chalcones $\mathbf{3 7 7}$ and $\mathbf{3 7 8}$ did not release active p53, while chalcones 318 and $\mathbf{3 7 9}$ removed MDM2 from the complex with p53, with 379 fully removing HDM2. ${ }^{252}$

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Multidimensional NMR spectroscopy experiments with the carboxylic acid chalcones 318 and 377-379 showed that the chalcones dock in the tryptophan-binding subsite of human HDM2 p53 binding site and disrupt the HDM2/p53 protein complex. The carboxylic acid groups are thought to be important to the activity of the chalcones by disrupting the salt bridge between lysine 51 and glutamic acid 54 in the tryptophan subsite of human HDM2 bound p53. ${ }^{252}$

Kumar et al investigated the effects of replacing the carboxylic acid group of these chalcones with a boronic acid. ${ }^{253}$ The boronic acids are weaker acids $\mathrm{pK}_{\mathrm{a}} 9-10$ and will be largely nonionized at physiological pH , they are therefore unlikely to form a salt bridge with lysine51, however it was proposed that they may form a covalent bond to the amino group of lysine51 instead, resulting in a stronger interaction with p53 binding site of HDM2.

The MTT assay showed that the carboxylic acid chalcones 318 and 379 were not selectively toxic to cancer cell lines, with $\mathrm{IC}_{50}$ values ranging from $9-18 \mu \mathrm{M}$ for the human breast cancer cell lines and $\mathrm{IC}_{50}$ values ranging from $12-28 \mu \mathrm{M}$ for the normal human breast cell lines, however several of the boronic acid chalcones $\mathbf{3 1 9}$ and $\mathbf{3 8 0}$ showed a greater selectivity to cancer cells with $\mathrm{IC}_{50}$ values ranging from $7-18 \mu \mathrm{M}$ for the human breast cancer cell lines and $\mathrm{IC}_{50}$ values ranging from $38-100 \mu \mathrm{M}$ for the normal human breast cell lines, (Figure 39). ${ }^{253}$

318
$\mathrm{IC}_{50}$ (breast cancer cell lines) $13-18 \mu \mathrm{M}$
$\mathrm{IC}_{50}$ (normal breast cell lines) $12-28 \mu \mathrm{M}$

380
$\mathrm{IC}_{50}$ (breast cancer cell lines) $7.0-10 \mu \mathrm{M} \quad \mathrm{IC}_{50}$ (breast cancer cell lines) $9.5-18 \mu \mathrm{M}$
$\mathrm{IC}_{50}$ (normal breast cell lines) 63-75 $\mu \mathrm{M} \quad \mathrm{IC}_{50}($ normal breast cell lines) $38-100 \mu \mathrm{M}$

Figure 39: $\mathrm{IC}_{50}$ values of carboxylic acid chalcones $\mathbf{3 1 8} \& 379$ compared against boronic acid chalcones 380 \& 319 against human breast cancer cell lines (MDA-MB-435, MDA-MB-231 \& Wt-MCF7) and normal beast cell lines (MCF-10A \& MCF-12A) ${ }^{233}$

Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion
However multidimensional NMR spectroscopy experiments carried out by D'Silva ${ }^{295}$ and co-workers recently, show that the boronic chalcone 381 does not dissociate the p53-HDM2 complex, but 381 does bind to the tryptophan-binding subsite

381 of human MDM2 p53-binding cleft, and that they may be extremely weak inhibitors of the MDM2/p53 interaction.

### 4.3.1 Synthesis of the $\mathbf{3}^{\prime}, \mathbf{4}^{\prime}$-dichlorochalcones

We decided to make a small series of $3^{\prime}, 4^{\prime}$-dichlorochalcones without the carboxylic acid group to see if it was a requirement for disrupting the HDM2/p53 interaction. The chalcones were be prepared by the Claisen-Schmidt condensation ${ }^{178}$ of the $3^{\prime} 4^{\prime}$-dichloroacetophenone (382) and various substituted benzaldehydes (Scheme 72).

382

Scheme 72: a. 2 M NaOH (aq), MeOH, r.t., overnight
The $3^{\prime}, 4^{\prime}$-dichlorochalcones were prepared by treating $3^{\prime} 4^{\prime}$-dichloroacetophenone (382) and a substituted benzaldehyde in methanol with 2 M sodium hydroxide. The product chalcone was left overnight to precipitate out of the methanol solution. They were then filtered off and recrystallized from methanol (Scheme 73).

|  | Chalcone | Ar $^{1}$ |  | Yield (\%) |
| :---: | :---: | :---: | :---: | :---: |

Scheme 73: a. $\mathrm{Ar}^{\mathrm{l}} \mathrm{CHO}, 2 \mathrm{M} \mathrm{NaOH}(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight.
The 3', $\mathbf{4}^{\prime}$-dichlorochalcones $\mathbf{3 8 3}$ - $\mathbf{3 9 0}$ were all isolated in moderate to excellent yields as the $E$-isomers as shown by their ${ }^{1} \mathrm{H}$ NMR spectra.

We then tried to prepare ( $E$ )-1-( $3^{\prime}, 4^{\prime}$-dichlorophenyl)-3-(4''-hydroxyphenyl)prop-2-en-1-one (391) via the basic Claisen-Schmidt condensation ${ }^{178}$ of the $3^{\prime} 4^{\prime}$-dichloroacetophenone (382)

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

and 4-hydroxybenzaldehyde (328) This reaction failed due to the reduced electrophilicity of the carbonyl group of $\mathbf{3 2 8}$ because the electron donating effect of the deprotonated 4 -hydroxy group. The starting materials were recovered. We attempted the acidic Claisen-Schmidt condensation of the $3^{\prime} 4^{\prime}$-dichloroacetophenone (382) and 4-hydroxybenzaldehyde (328) reported by Dimmock ${ }^{224}$ et al, whereby chalcone was prepared by bubbling hydrogen chloride though a solution of 382 and 328 in ethanol, the mixture turned red and was left stirring at room temperature overnight. However this reaction also failed and the $3^{\prime} 4^{\prime}-$ dichloroacetophenone (382) was recovered. We then prepared the MOM protected chalcone 392 from the MOM protected benzaldehyde 332 and the acetophenone 382 (Scheme 74). The MOM protected chalcone 392 was then deprotected by refluxing the chalcone in methanol and in the presence of 3 M hydrochloric acid for 45 minutes (Scheme 74). ${ }^{230}$ This gave 391 as yellow solid in an excellent yield, as the $E$-isomer shown by inspection of its ${ }^{1} \mathrm{H}$ NMR spectrum $\left(J_{\mathrm{Ha}, \beta} 15.4 \mathrm{~Hz}\right)$.

391

Scheme 74: a. 2 M NaOH (aq), MeOH , r.t., overnight, $65 \%$; b. $3 \mathrm{M} \mathrm{HCl}(\mathrm{aq}), \mathrm{MeOH}, 75$ ${ }^{\circ} \mathrm{C}, 45$ mins, $99 \%$.

We also prepared the carboxylic acid chalcone 318 so we could directly compare the biological results of the $3^{\prime}, 4^{\prime}$-dichlorochalcones with and without the carboxylic acid group. The chalcone 318 was prepared using the Claisen-Schmidt condensation ${ }^{178}$ of the $3^{\prime} 4^{\prime}$ dichloroacetophenone (382) and 4-formylphenoxyacetic acid (393) in methanol under basic conditions (Scheme 75). The chalcone was isolated by ethyl acetate extraction and recrystallization from methanol to give 318 in good yield as yellow crystals.

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

Scheme 75: a. $2 \mathrm{M} \mathrm{NaOH}(\mathrm{aq}), \mathrm{MeOH}$, r.t., overnight, $66 \%$.
The key diagnostic peak of the ${ }^{1} \mathrm{H}$ NMR spectrum of carboxylic acid chalcone 318 are the peak for the methylene group which appears at $4.76\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{\prime}{ }^{\prime \prime}\right) \mathrm{ppm}$ and the peaks for enone system of 318 at $7.74(1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-2)$ and $7.83(1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-3) \mathrm{ppm}$ showing that chalcone was isolated as the E-isomer (Figure 40). The ${ }^{\mathrm{l}} \mathrm{H}$ NMR spectrum of 318 corresponds to the literature values reported by $K_{u m a r}{ }^{233}$ et al.

Figure 40: ${ }^{1} \mathrm{H}$ NMR spectrum of the carboxylic acid chalcone 318

Our chalcones were tested for their ability to disrupt the p53-MDMX complex. The chalcones were screened in an ELISA (Enzyme-Linked ImmunoSorbent Assay) assay ${ }^{296}$ using p53 and MDMX proteins purified from E. coli. This ELISA assay measures the binding of the MDMX protein to the p53 protein which is immobilized on the surface of the ELISA plate, by looking at the absorbance of the plate at a wavelength of 450 nm . The ELISA plates are first treated with p53 and incubated in PBS (phosphate buffered saline) for 16 hours, so the p53 can bind to the ELISA plate. The plate was then washed with PBST (PBS $+0.1 \%$ Tween 20), and then blocked with PBSMT (PBS $+5 \%$ nonfat dairy milk $+0.1 \%$ Tween 20) for 30 minutes. The chalcones were then dissolved in DMSO. The MDMX ( $5 \mu \mathrm{~g} / \mathrm{ml}$ ) was then mixed with the DMSO dissolved chalcone (at various concentrations) in PBSMT. The MDMX/chalcone mixture was then added to the wells of the plate. The plate was then incubated for an hour and then washed with PBST. The antibody 5B10 in PBSMT was then added to the plates for 1 hour, followed by washing and incubation with horseradish peroxidase-rabbit anti-mouse immunoglobulin antibody for an hour. The antibody 5 B 10 is used to detect the MDMX binding to P53. The plate was then developed by incubation with tetramethyl benzidine peroxides substrate and measured by absorbance at $450 \mathrm{~nm} .{ }^{296}$

MDMX is a protein related to MDM2 and shares several regions of homology with MDM2 including the p53 binding site. ${ }^{297}$ The only chalcone to show any activity below a concentration of $300 \mu \mathrm{M}$, was the chalcone 318 with an $\mathrm{IC}_{50}(\mathrm{p} 53-\mathrm{MDMX})$ of $250 \mu \mathrm{M}$. This

## Chapter 4 - Other Cytotoxic Chalcones. Results and Discussion

shows that the presence of the carboxylic acid group on 3,4-dichalcone 318 plays an important role in the disruption of the HDM2/p53 interaction.

The chalcone 394 which was prepared by another member of the our group exhibited an $\mathrm{IC}_{50}$ value of $80 \mu \mathrm{M}$ for the inhibition of the p53-MDMX interaction, however further testing showed that 394 had no effect on p53-MDM2 interaction, up to a concentration of $500 \mu \mathrm{M}$. While the chalcone 319 shows a weak activity at inhibiting both the p53-MDMX and p53MDM2 interaction. This makes 394 a good lead structure for the optimization of potency of a selective p53-MDMX inhibitor. Presently the crystal structure of MDMX is unknown, so a model of the p53 binding site, based on the MDM2 model will be constructed by the computer modelers, which can be used cautiously for structure-based design for the optimization of 394. Traditional QSAR (quantitative structure-activity relationships) studies will also be used in the optimization of 394 as a selective p53-MDMX inhibitor.

394
$\mathrm{IC}_{50}(\mathrm{p} 53-\mathrm{MDMX}) 80 \mu \mathrm{M}$
$\mathrm{IC}_{50}(\mathrm{p} 53-\mathrm{MDM} 2)>500 \mu \mathrm{M}$

318
$\mathrm{IC}_{50}$ (p53-MDMX) $250 \mu \mathrm{M}$
IC $\mathrm{S}_{0}$ (p53-MDM2) $250 \mu \mathrm{M}$

## Chapter 5 - Heat Shock Proteins as targets for drug design

### 5.1 Hyperthermia and the prevention of thermotolerance via drug like compounds

Hyperthermia is a type of cancer treatment in which body tissue is exposed to high temperatures, $40-44^{\circ} \mathrm{C}$. In vivo tests show that hyperthermia treatment selectively kills tumour cells at temperatures between $40-44^{\circ} \mathrm{C},{ }^{298}$ while normal tissues are undamaged at exposure to these temperatures. ${ }^{299}$ Tumour tissue is more sensitive to hyperthermia because of the chaotic architecture of the tumour vasculature in solid tumours, which result in regions of the tumour tissue which have low pH and suffer from hypoxia. ${ }^{298,300}$ These environmental differences make tumour cells more sensitive to hyperthermia treatment. The main mechanism for cell death is thought to be caused by protein denaturation, which is observed at temperatures $>40{ }^{\circ} \mathrm{C}$, this can lead to the alteration of cellular structures like the cytoskeleton and membranes, and changes in enzyme complexes used for DNA synthesis and repair. ${ }^{301}$

The use of hyperthermia in conjunction with radiotherapy ${ }^{302-306}$ or chemotherapy ${ }^{307}$ has been shown to increase the anticancer effects of both therapies. However one of the major problems with hyperthermia is the development of thermotolerance, which is a transient resistance to the effects of hyperthermia induced by prior exposure to heat treatment. ${ }^{308,309}$ When cells are exposed to heat they respond by synthesizing a group of proteins called the heat shock proteins (HSPs) ${ }^{310}$ which are involved in the acquisition of thermotolerance in cells. ${ }^{311.312}$ The HSPs bind to denatured proteins caused by cellular stress such as heat shock and renature them or bring them to degradation pathways. ${ }^{302}$ Several studies ${ }^{312-314}$ have shown the relationship between the level of thermotolerance and cellular content of the HSPs, one study showed that the introduction of HSP72 specific antibodies to fibroblast cells made them more sensitive to thermal stress. ${ }^{315}$ These studies suggest that a strong relationship between the induction of stress proteins in the prevention of apoptosis. ${ }^{302}$

The regulation of the synthesis of the HSP is mediated by the interaction of the heat shock factor (HSF1) with the heat shock elements (HSEs) in the heat shock protein gene promoter region. ${ }^{316,317}$ HSF1 exists in unstressed cells in an inactive form and is rapidly activated after heat shock. ${ }^{302}$

It is critical for the further development of hyperthermia as a cancer therapy to find drug like compounds that can specifically inhibit the induction of HSPs in cancer cells after their first heat treatment to help improve the effects of fractionated hyperthermia. ${ }^{302.318}$

The flavonoid quercetin (395) has been shown to inhibit the synthesis of several HSPs (including HSP70) induced by heat shock on 2 human cancer cell lines, HeLa and COLO

## Chapter 5 - Heat Shock Proteins as targets for drug design

320DM. ${ }^{319}$ In vivo and in vitro tests show that the quercetin (395) inhibits the induction of the HSP by suppressing the activation of the HSF1, or the interaction of the HSF1 with the HSEs. ${ }^{320}$
 In vitro testing of the novel benzylidene lactam compound KNK437 (396) by Yokota ${ }^{302}$ and co-workers showed that it was a dose dependant inhibitor of the acquisition of thermotolerance in COLO 320DM (human colon carcinoma) cells and in HeLa S3 cells after fractionated heat treatment. Further testing showed that 396 inhibits the synthesis of various HSPs including HSP70, HSP40 and HSP105. ${ }^{302}$

Further in vivo testing of KNK437 (396) by Koishi ${ }^{318}$ and co-workers, showed that KNK437 (396) inhibited the induction of thermotolerance at a concentration of $200 \mathrm{mg} / \mathrm{kg}$ when administrated 6 hours before initial heating. The time taken for the tumour to triple in volume was on average 2.9 days longer than that for tumours that had been heat shocked without the

396

397 KNK437. ${ }^{318}$ Showing that KNK437 had contributed to the inhibition of the synthesis of HSP in vivo. They also found that the KNK437 (396) was metabolized to KNK423 (397) which was observed by HPLC at high levels in tumours that had been administered with KNK437 (396). ${ }^{318}$

The effects of KNK 437 (396) proved to be cytostatic and reversible over time, rather than being cytotoxic. ${ }^{302}$ Further testing showed that KNK 437 (396) was a very weakly toxic drug, with tumour free mice recovering the lost body weight by 2 days after treatment of 396 at concentrations up to $400 \mathrm{mg} / \mathrm{kg}^{318}$

It is thought that the inhibitory mechanism of KNK437 may be attributed to the inhibition of the HSF1, or the interaction of the HSF1 with the HSEs, as reported for the bioflavonoid Quercetin. ${ }^{302,320}$

### 5.2 Synthesis of KNK437 and similar analogues.

Our route for the synthesis of KNK 437 (396) involved the aldol condensation of 1-acetylpyrrolidin-2-one (398) and piperonal (399) to give KNK423 (397) ${ }^{321}$ (Scheme 76). KNK 437 (396) would then be obtained via the formylation of the amine on the 2pyrrolidinone ring of 397 (Scheme 76). ${ }^{322}$

## Chapter 5 - Heat Shock Proteins as targets for drug design

Scheme 76
Before we carried out the aldol condensation of piperonal (399) and 1-acetylpyrrolidin-2-one (398), the 1-acetylpyrrolidin-2-one (398) had to be prepared by acetylating the nitrogen of 2pyrrolidinone (400) (Scheme 77). Using the procedure described by Sasaki ${ }^{323}$ and coworkers 1 -acetylpyrrolidin-2-one (398) was prepared by adding acetyl chloride to a mixture of triethylamine and 2-pyrrolidinone in THF at $0^{\circ} \mathrm{C}$ (Scheme 77 , route a). The isolation of 398 as described by Sasaki ${ }^{323}$ was done by distillation, however after collecting the distillate at $152-155^{\circ} \mathrm{C}$ the ${ }^{1} \mathrm{H}$ NMR spectrum showed that the distillate was an $1: 1$ mixture of the starting pyrrolidinone (400) and desired acetylated product 398. The acetylated product 398 was then isolated from $\mathbf{4 0 0}$ by column chromatography in a moderate yield.

It was also found by other members of the group that the acetylation of $\mathbf{4 0 0}$ can be achieved by treating the 2-pyrrolidinone (400) in anhydrous THF with $2.5 \mathrm{M} n$-butyllithium in hexanes at $-20^{\circ} \mathrm{C}$ and then by adding acetyl chloride to a mixture and then leaving the mixture stirring overnight (Scheme 77, route b). The acetylated product 398 was then isolated by chromatography in a good yield.

Scheme 77: a. acetyl chloride, triethylamine, THF, $0^{\circ} \mathrm{C}-$ r.t., $1 \mathrm{hr}, 52 \%$; b. i. $n \mathrm{BuLi}$, THF, $-20^{\circ} \mathrm{C}$, ii. acetyl chloride, THF, $-20^{\circ} \mathrm{C}$ to r.t., overnight, $71 \%$.

Then using the technique described by Zimmer $^{321}$ et al. the benzylidene lactam compound KNK423 (397) was prepared by treating 1-acetylpyrrolidin-2-one (398) and piperonal (399) in anhydrous THF at $0^{\circ} \mathrm{C}$ with sodium hydride (Scheme 78). After an hour the reaction was quenched by treating the mixture with methanol, and then tipped into $6 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$. The product was then extracted with chloroform, and was recrystallized from iso-propyl alcohol as a fine cream powder in a low yield. However, this provides sufficient material for the biological studies.

## Chapter 5 - Heat Shock Proteins as targets for drug design

Scheme 78: a. NaH, THF, $0^{\circ} \mathrm{C}, 1 \mathrm{hr}, 27 \%$; b. formic acid, $105^{\circ} \mathrm{C}, 18 \mathrm{hrs}, 55 \%$.
The KNK 423 (397) was fully characterised; the HRMS of 397 gave a molecular ion [ $\mathrm{MH}^{+}$] of $m / z 218.0812$ which corresponds to the expected formula $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{O}_{3} \mathrm{~N}$. The key diagnostic peaks in the ${ }^{1} \mathrm{H}$ NMR spectrum of 397 are two signals for the 2-pyrrolidinone ring $3.12(2 \mathrm{H}$, td, $J 6.5 \mathrm{~Hz}, J 2.8 \mathrm{~Hz}, \mathrm{H}-4)$ and $3.56(2 \mathrm{H}, \mathrm{t}, J 6.5 \mathrm{~Hz}, \mathrm{H}-5) \mathrm{ppm}$ and the signal for methylene proton at $7.28\left(1 \mathrm{H}, \mathrm{t}, J 2.8 \mathrm{~Hz}, \mathrm{H}-1^{\prime}\right)$ ppm (Figure 41 ).

Figure 41: ${ }^{1} \mathrm{H}$ NMR spectrum of KNK423 (397)
Using the procedure described by Rigo ${ }^{322}$ et al. 397 was formylated by heating in neat refluxing formic acid for 18 hrs (Scheme 78). After which time the reaction mixture was a 1:1.9 ratio of the starting KNK423 (397) to the product KNK437 (396). The KNK437 (396) was then isolated via column chromatography as a white solid in a moderate yield.

The KNK 437 (396) was fully characterised; the HRMS of 396 gave a molecular ion $\left[\mathrm{MH}^{+}\right]$of $m / z 246.0758$ which corresponds to the required $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{4} \mathrm{~N}$ formula. The key diagnostic peaks in the ${ }^{1} \mathrm{H}$ NMR spectrum of 396 is the loss of the signal for the 397 amine proton of at $6.45(1 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{NH}-1)$ ppm (Figure 41) and introduction of the signal for the formyl group at 9.24 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1{ }^{\prime} ’ ’$ ) ppm (Figure 42).

396

## Chapter 5 - Heat Shock Proteins as targets for drug design

Figure 42: ${ }^{1} \mathrm{H}$ NMR spectrum of KNK 437 (396)

Figure 43: NOESY NMR spectrum of KNK437 (396) showing the nOe correlations between the signals of H-4 and H-7'’, and H-4 and H-5'’proving the E-geometry of $\mathbf{3 9 6}$.

The geometry of double bond of KNK437 (396) was determined by a NOESY NMR experiment (Figure 43). The NOESY experiment of 396, shows nOe correlations between the signals for the $\mathrm{H}-4$ hydrogens at 3.09 ppm to the $\mathrm{H}-7$ "' hydrogen at 7.00 ppm , as well as

Chapter 5 - Heat Shock Proteins as targets for drug design
the $\mathrm{H}-5^{\prime}$, hydrogen at 7.06 ppm proving that the $E$-isomer of KNK 437 (396) was isolated from the reaction.

One of the main problems with KNK437 (396) and KNK423 (397) is their poor solubility in DMSO, KNK437 (396) solubility in DMSO $\sim 25 \mathrm{mg} / \mathrm{ml}$, while KNK423 (397) solubility in DMSO $\sim 20 \mathrm{mg} / \mathrm{ml}$.

We therefore decide to investigate producing a more soluble version of the KNK compounds. To do this we decided to use rhodanine (401) instead of 1-acetylpyrrolidin-2-one (398) in the synthesis. The introduction of the rhodanine (401) into the KNK structure gives the molecule an extra sulfide group and thioamide group, which should improve the solubility of the molecule. The heteroatom should increase the number of hydrogen bonds that the KNK rhodanine analogues can make with a polar solvent, thus enhancing the overall solubility of these compounds in polar solvents.

The rhodanine analogue 402 of KNK423 (397) was prepared using the same conditions for the synthesis of KNK423 (397) ${ }^{321}$ (Scheme 79).

Figure 44: ${ }^{1} \mathrm{H}$ NMR spectrum of rhodanine analogue 402 of KNK423
The key diagnostic peak of the ${ }^{1} \mathrm{H}$ NMR spectrum of rhodanine analogue 402 of KNK423 (397) are the signals for the aromatic hydrogens which appear at $7.08\left(1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}, \mathrm{H}-4{ }^{\prime \prime}\right), 7.11\left(1 \mathrm{H}, \mathrm{d}, J 1.9 \mathrm{~Hz}, \mathrm{H}-7^{\prime}{ }^{\prime}\right)$ and $7.15\left(1 \mathrm{H}, \mathrm{dd}, J 1.9 \mathrm{~Hz}, J 8.0 \mathrm{~Hz}, \mathrm{H}-5^{\prime \prime}\right) \mathrm{ppm}$, and the olefinic proton at

402 $7.56(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1$ ') ppm (Figure 44).

It was found that we could dissolve up to 35 mg of 402 in 1 ml of DMSO. This made it more soluble than KNK423 (397) (ca. 20 mg could be dissolved in 1 ml of DMSO).

## Chapter 5 - Heat Shock Proteins as targets for drug design

We then made a small series of other KNK like rhodanine analogues using various substituted benzaldehydes to investigate the effects of changing the aromatic group on the biological properties of the molecule. Another six KNK rhodanine analogues 403 - 408 were prepared using the same method as previously described (Scheme 79).

|  | KNK analogues | $\mathrm{Ar}^{1}$ | Yield (\%) |
| :---: | :---: | :---: | :---: |
|  | 402 | Benzo[d][1,3]dioxol-5-yl | 65 |
|  | 403 | 2,4-Dichlorophenyl | 44 |
|  | 404 | 5-Bromo-2-methoxyphenyl | 52 |
|  | 405 | 4-Methoxyphenyl | 66 |
|  | 406 | 3,5-Dimethoxyphenyl | 63 |
| Scheme 79: a. $\mathrm{Ar}^{1} \mathrm{CHO}$, $\mathrm{NaH}, \mathrm{THF}, 0^{\circ} \mathrm{C}, 1 \mathrm{hr}$. | 407 | 3,4,5-Trimethoxyphenyl | 40 |
|  | 408 | 2,4,6-Trimethoxyphenyl | 81 |

The ${ }^{1} \mathrm{H}$ NMR spectrum of the KNK rhodanine analogue 405 corresponded to $Z$-isomer of 405 which had been previously prepared by Khodair, ${ }^{324}$ therefore the $Z$-isomer of 405 had been prepared. This is the same geometrical sense as for the KNK437 (396), but 405 is labeled $Z$, since the CIP rankings have changed.

Others members of our group continued the investigation into developing a more soluble version of the KNK compounds.

### 5.3 Biological results of KNK437 and its analogues

A number of proteins associated with leukaemia require interaction with HSP90 to maintain a mature and functional conformation. ${ }^{325,326}$ The semi-synthetic derivative 17-allylaminodemethoxygeldananycin (17-AGG, 409) has been shown to inhibit the function of HSP90, ${ }^{327}$ and leads to the degradation of its HSP90 associated proteins. ${ }^{325326}$ 17-AGG (409) is currently being investigated in phase 1 and 2 clinical trials, administered alone or

409 in combination with other anticancer agents. ${ }^{38.329}$

The HSP90 also binds HSF1. ${ }^{330}$ When 17-AGG (409) binds to HSP90, it displaces bound HSF1. This increased level of HSF1 led to the up-regulation of the antiapoptotic HSP72. ${ }^{330-332}$ Therefore the question arises, whether the elimination of the antiapoptotic HSP72 by cotreating with KNK437 (396) will further sensitize the human leukaemia (HL-60) cells to 17AGG (409) treatment? ${ }^{333}$

Chapter 5 - Heat Shock Proteins as targets for drug design

Figure 45: The effect on apoptosis of HL-60 cells after being pretreated with KNK437 (396) for an hour, followed by 17-AAG (409) + KNK437 (396) for 72 hours. ${ }^{333}$

The KNK437 (396) we made was then used in a study by Guo ${ }^{333}$ et al. The study found that KNK437 (396) sensitizes human leukaemia (HL-60) cells to 17-AGG (409) induced apoptosis (Figure 45)..$^{333}$ For instance treating the HL-60 cells with only $2.0 \mu \mathrm{M}$ 17-AGG (409) caused apoptosis in about $40 \%$ of the HL- 60 cells after 72 hours, while treatment with $2.0 \mu \mathrm{M}$ 17-AGG (409) and $100 \mu \mathrm{M}$ KNK437 (396) increased apoptosis to about $55 \%$. Treating the HL-60 cells with $2.0 \mu \mathrm{M}$ 17-AGG (409) and $400 \mu \mathrm{M}$ KNK437 (396) increased the apoptosis again to $65 \%$ of the HL-60 cells (Figure 45). ${ }^{333}$

## Chapter 6 - Experimental <br> General Experimental Information

Nuclear Magnetic Resonance Spectrometry
${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR were carried out on a Bruker 400 MHz spectrometre and Varian 400 MHz spectrometre; chemical shifts for ${ }^{1} \mathrm{H}$ NMR are referenced to tetramethylsilane (TMS) as an internal standard, and chemical shifts for ${ }^{13} \mathrm{C}$ NMR are referenced to the solvent used.

## Infra-red Spectroscopy

IR spectras were obtained for the compounds using a Perkin Elmer 1600 series FTIR instrument, Perkin-Elmer Spectrum One FTIR Spectrometre and JASCO FT/IR 4100 Spectrometre

## Mass Spectrometry

Low resolution mass spectra were determined using a Fisons VG Platform II Quadrupole instrument and Agilent Technologies LC/MSD VL instrument. High resolution mass spectroscopy was carried out by the EPSRC national mass spectrometry service centre at Swansea University, as well as on an Agilent Technologies LC/MSD TOF instrument at the University of South Florida.

## Elemental Analysis and Melting Point

Elemental analyses were performed by Warwick Analytical Services Ltd. Melting points were determined using Electrothermal Mel-Temp* manual melting point apparatus and Electrothermal Digital melting point apparatus model 9100, they were not corrected.

## Chromatography and Solvents

Column chromatography was performed using silica gel 60, 220-440 mesh (Apollo in the UK and Fisher in the US). Automated flash chromatography was conducted using a Flashmaster II system (Argonaut-Biotage), using Biotage silica cartridges. Thin layer chromatography was performed using silica gel $60 \mathrm{~F}_{254}$ plates (Apollo in the UK and Fisher in the US), with observation under UV when necessary. Anhydrous solvents were obtained as follows: dichloromethane (anhydrous, $99.8 \%$, contains $50-150 \mathrm{ppm}$ hydrocarbon as stabilizer from Aldrich), dimethyl formamide (anhydrous, $99.8 \%$ from Aldrich), tetrahydrofuran (distilled over sodium/benzophenone under nitrogen as required).

## Chapter 6 - Experimental

Protocol A
To a stirring solution of substituted acetophenone and substituted benzaldehyde in methanol was added a quantity of an aqueous solution of sodium hydroxide and the mixture stirred at room temperature overnight allowing the chalone to precipitate. The precipitate was then filtered off and washed with cold aqueous methanol ( $4: 1 \mathrm{MeOH}: \mathrm{H}_{2} \mathrm{O}$ ). Purified by recrystallization from methanol.
(E)-1-(3,4,5-Trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one $165^{334335}$

165
The chalcone 165 was obtained following Protocol A. Using 3,4,5-trimethoxyacetophenone $(8.65 \mathrm{~g}, 41.1 \mathrm{mmol})$, $p$-anisaldehyde $\left(5.0 \mathrm{~cm}^{3}, 41.1 \mathrm{mmol}\right)$ and aqueous sodium hydroxide solution ( $6.9 \mathrm{~cm}^{3}, 12 \mathrm{M}$ ) in methanol ( $25 \mathrm{~cm}^{3}$ ). Recrystallization from methanol afforded 165 as cream crystals ( $12.1 \mathrm{~g}, 37.0 \mathrm{mmol}, 90 \%$ ); m.p. $98-99^{\circ} \mathrm{C} ; \mathrm{R}_{f} 0.73\left(\mathrm{SiO}_{2}\right.$, hexane:ethyl acetate $1: 1$ ); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3007,2941,2843,1655,1591,1567,1505,1459,1447,1420,1411$, $1345,1308,1248,1153,1121,998,979,812,824,709 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.95\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.95\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right.$, \& H-5’'), 7.27 (2H, s, H-2' \& H-6'), 7.37 ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J} 15.6 \mathrm{~Hz}, \mathrm{H}-2$ ), 7.62 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-2^{\prime \prime}$ \& H-6'), $7.80(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 15.6 \mathrm{~Hz}, \mathrm{H}-3) ; \delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 55.46 (s, $\left.\mathrm{OCH}_{3}\right), 56.39\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.02\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 105.90(\mathrm{~s}, \mathrm{CH}), 114.44(\mathrm{~s}, \mathrm{CH}), 119.37(\mathrm{~s}, \mathrm{CH})$, 127.59 ( $\mathrm{s}, \mathrm{C}$ ), 130.28 ( $\mathrm{s}, \mathrm{CH}$ ), 133.85 ( $\mathrm{s}, \mathrm{C}$ ), 142.19 ( $\mathrm{s}, \mathrm{C}$ ), 144.68 ( $\mathrm{s}, \mathrm{CH}$ ), 153.12 ( $\mathrm{s}, \mathrm{C}$ ), $161.70(\mathrm{~s}, \mathrm{C}), 189.32(\mathrm{~s}, \mathrm{CO}) ; m / z(\mathrm{AP}+) 329\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 329.1385$ for $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{O}_{5}, \mathrm{C}_{19} \mathrm{H}_{21} \mathrm{O}_{5}$ requires $[\mathrm{MH}]^{+}$329.1384; CHN found $\mathrm{C} 69.16 \%$, H $6.14 \%$, CHN requires C $69.50 \%$, H 6.14\%.

## 2,3-Dibromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)propan-1-one 166 ${ }^{34}$

166
To a stirring solution of (E)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1one $165(0.92 \mathrm{~g}, 2.8 \mathrm{mmol})$, in chloroform $\left(15 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$ under nitrogen, was added a solution of bromine in chloroform $\left(2.8 \mathrm{~cm}^{3}, 1 \mathrm{M}\right)$. The mixture was then stirred at $0^{\circ} \mathrm{C}$ for

## Chapter 6 - Experimental

one hour. The chloroform was then removed in vacuo to give the crude product 166 as a light pink solid ( $1.35 \mathrm{~g}, 2.8 \mathrm{mmol}, 99 \%$ ); m.p. $129-130{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.85 \& 0.66\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\text {max }} .\left(\mathrm{cm}^{-1}\right) 3006,2941,2841,1663,1607,1580,1515,1504,1455,1414$, $1332,1244,1123,991,767 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.77\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.59(1 \mathrm{H}, \mathrm{d}, J 11.3 \mathrm{~Hz}, \mathrm{H}-3), 5.69(1 \mathrm{H}, \mathrm{d}, J 11.3 \mathrm{~Hz}, \mathrm{H}-$ 2), $6.88\left(2 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-3^{\prime \prime} \& \mathrm{H}-5^{\prime}{ }^{\prime}\right), 7.27(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2$ ' \& H-6'), $7.40(2 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-$ $2^{\prime}$ ' \& H-6' ${ }^{\prime}$ ); $\delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 47.04 ( $\mathrm{s}, \mathrm{CHBr}$ ), 50.42 ( $\mathrm{s}, \mathrm{CHBr}$ ), 55.39 $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 56.52\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.08\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.52(\mathrm{~s}, \mathrm{CH}), 114.24(\mathrm{~s}, \mathrm{CH}), 129.43(\mathrm{~s}, \mathrm{C})$, 129.71 ( $\mathrm{s}, \mathrm{CH}$ ), 130.23 ( $\mathrm{s}, \mathrm{C}$ ), 143.69 ( $\mathrm{s}, \mathrm{C}$ ), 153.33 ( $\mathrm{s}, \mathrm{C}$ ), 160.17 ( $\mathrm{s}, \mathrm{C}$ ), 190.17 ( $\mathrm{s}, \mathrm{C}=\mathrm{O}$ ).
(Z)-2-Bromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one 167

Triethylamine ( $50 \mathrm{~cm}^{3}$ ) was slowly added to a stirring solution of (2,3-dibromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)propan-1-one 166 ( $2.44 \mathrm{~g}, 5.0 \mathrm{mmol}$ ), in chloroform $\left(5 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$ under nitrogen. The mixture was then stirred overnight at room temperature, and then heated to $95^{\circ} \mathrm{C}$ for 1 hour. The triethylamine was then evaporated in vacuo, the crude compound was then dissolved in chloroform ( $30 \mathrm{~cm}^{3}$ ) and washed with water ( $3 \times 20$ $\mathrm{cm}^{3}$ ) and saturated sodium bicarbonate solution ( $2 \times 20 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Recrystallization from ethyl acetate and hexane afforded 167 as fine cream crystals ( $1.22 \mathrm{~g}, 3.0 \mathrm{mmol}, 60 \%$ ) m.p. 111-112 ${ }^{\circ} \mathrm{C} ; \mathrm{R}_{f} 0.64\left(\mathrm{SiO}_{2}\right.$, hexane:ethyl acetate $\left.1: 1\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2935,2837,1642$, $1581,1504,1461,1448,1411,1327,1249,1121,1099,1028,827,712 ; \delta{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right) 6.97(2 \mathrm{H}, \mathrm{d}$,
 $\mathrm{H}-2^{\prime \prime}$ \& $\left.\mathrm{H}-6^{\prime}{ }^{\prime}\right) ; \delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $55.47\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $56.38\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $61.05\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 107.14$ (s, CH), 114.04 (s, CH), 119.77 (s, C), 126.02 (s, CBr), 131.89 (s, C), 132.55 ( $\mathrm{s}, \mathrm{CH}$ ), 141.81 ( $\mathrm{s}, \mathrm{C}$ ), 142.47 ( $\mathrm{s}, \mathrm{CH}$ ), 152.96 (s, C), 161.47 (s, C), 190.89 (s, $\mathrm{C}=\mathrm{O}) ; m / z(\mathrm{AP}+) 407\left(\mathrm{MH}^{+}, 80 \%\right), 409\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 407.0489$ for $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{5} \mathrm{Br}, \mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{5} \mathrm{Br}$ requires $[\mathrm{MH}]^{+} 407.0489$; CHN found $\mathrm{C} 56.05 \%, \mathrm{H} 4.78 \%$, CHN requires C 56.03\%, H 4.70\%.

## Chapter 6 - Experimental

(IE,4E)-1,5-Diphenylpenta-1,4-dien-3-one $\mathbf{1 7 0}^{336}$

The method adopted was that of Shoppee ${ }^{201}$ et al. To a stirring solution of acetone $\left(3.7 \mathrm{~cm}^{3}\right.$, $50.4 \mathrm{mmol})$ and benzaldehyde ( $10.3 \mathrm{~cm}^{3}, 101.3 \mathrm{mmol}$ ), in ethanol $\left(80 \mathrm{~cm}^{3}\right)$ was added an aqueous sodium hydroxide solution $\left(100 \mathrm{~cm}^{3}, 2.5 \mathrm{M}\right)$. The reaction was then allowed to stand for 1 hour, allowing the bright yellow solid to precipitate. The yellow solid was then filtered off and washed with water ( $3 \times 25 \mathrm{~cm}^{3}$ ). Recrystallization from ethyl acetate afforded 170 as bright yellow crystals ( $5.90 \mathrm{~g}, 25.2 \mathrm{mmol}, 50 \%$ ); m.p. $107-108^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.32$ $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right)$; $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3054,3026,1649,1626,1589,1574,1495$, $1447,1342,1192,980,883,760 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $7.09(2 \mathrm{H}, \mathrm{d}, J 16.2 \mathrm{~Hz}$, H-2), 7.39 - 7.44 (6H, m, H-3', H-4’ \& H-5'), $7.60-7.65$ (4H, m, H-2' \& H-6'), 7.75 ( $2 \mathrm{H}, \mathrm{d}$, $J 16.2 \mathrm{~Hz}, \mathrm{H}-3) ; \delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 125.66(\mathrm{~s}, \mathrm{CH}), 128.64(\mathrm{~s}, \mathrm{CH})$, 129.21 (s, CH), 130.74 (s, CH), 135.04 (s, C), 143.55 (s, CH), 189.16 (s, CO).

Bis(dibenzylideneacetone)palladium(0) 171 and tris(dibenzylideneacetone)dipalladium(0) chloroform $\mathbf{1 6 9}^{202}$

| $\mathrm{Pd}(\mathrm{dba})_{2}$ | $\mathrm{Pd}_{2}(\mathrm{dba})_{3} \mathrm{CHCl}_{3}$ |
| :---: | :---: |
| $\mathbf{1 7 1}$ | $\mathbf{1 6 9}$ |

The method adopted was that of Hegedus. ${ }^{202}$ To a stirring solution of ( $1 E, 4 E$ )-1,5-diphenylpenta-1,4-dien-3-one $170(4.60 \mathrm{~g}, 19.7 \mathrm{mmol})$ and sodium acetate ( $3.90 \mathrm{~g}, 47.5$ $\mathrm{mmol})$ in methanol $\left(150 \mathrm{~cm}^{3}\right)$ under argon at $50^{\circ} \mathrm{C}$, was added palladium chloride $(1.00 \mathrm{~g}$, 5.6 mmol ). The reaction was then cooled to $40^{\circ} \mathrm{C}$ and stirred at this temperature for 4 hours. The mixture was then left to cool to room temperature and allow the product to precipitate. The purple precipitate was then collected by filtration and washed with water ( $10 \mathrm{~cm}^{3}$ ) and acetone $\left(10 \mathrm{~cm}^{3}\right)$. The purple precipitate was then dried in vacuo and afforded 171 as a purple precipitate ( $3.21 \mathrm{~g}, 5.6 \mathrm{mmol}, 99 \%$ ). Bis(dibenzylideneacetone)palladium(0) 171 ( $2.42 \mathrm{~g}, 4.2 \mathrm{mmol}$ ) was then dissolved in hot chloroform $\left(90 \mathrm{~cm}^{3}\right)$ and filtered to give a deep purple solution. Diethyl ether $\left(120 \mathrm{~cm}^{3}\right)$ was then slowly added to the purple solution and the mixture was then left to crystallize over night. The crystals were then filtered and dried in vacuo to afford 169 as deep purple crystals ( $1.61 \mathrm{~g}, 1.6 \mathrm{mmol}, 74 \%$ ).

## Chapter 6 - Experimental

Protocol B
The method adopted was that of Mull ${ }^{200}$ et al. In a Schlenk tube a mixture of the $\alpha$-bromo chalcone ( 1.0 mmol ), boronic acid ( 1.2 mmol ), tris(dibenzylideneactone)dipalladium( 0 ) chloroform $169(0.023 \mathrm{~g}, 0.02 \mathrm{mmol})$ and triphenylphosphine ( $0.011 \mathrm{~g}, 0.04 \mathrm{mmol}$ ) was dissolved in toluene ( $6 \mathrm{~cm}^{3}$ ) and $n$-propanol ( $2 \mathrm{~cm}^{3}$ ), and then degassed by evacuation. After stirring for 10 mins , diethylamine $\left(0.13 \mathrm{~cm}^{3}, 1.3 \mathrm{mmol}\right)$ and $\mathrm{H}_{2} \mathrm{O}\left(1.6 \mathrm{~cm}^{3}\right)$ were added to the reaction. The mixture was degassed a second time, refluxed for a 1 hour at $100{ }^{\circ} \mathrm{C}$, then cooled to room temperature. The reaction was then poured into ethyl acetate $\left(100 \mathrm{~cm}^{3}\right)$ and washed with aqueous sodium hydroxide solution $\left(30 \mathrm{~cm}^{3}, 0.2 \mathrm{M}\right)$, aqueous hydrochloric acid ( $30 \mathrm{~cm}^{3}, 0.05 \mathrm{M}$ ) and water ( $2 \times 30 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. The product chalcone was then purified by means of column chromatography and/or recrystallization.
(E)-1-(3,4,5-Trimethoxyphenyl)-3-(4-methoxyphenyl)-2-phenylprop-2-en-1-one 172

172

The $\alpha$-arylchalcone 172 was obtained following Protocol B. Using ( $Z$ )-2-bromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one $\quad 167$ (0.407 $\quad \mathrm{g}, 1.0 \mathrm{mmol}$ ), phenylboronic acid $(0.147 \mathrm{~g}, 1.2 \mathrm{mmol})$. Recrystallization from ethyl acetate and hexane afforded 172 as cream fine needles $(0.172 \mathrm{~g}, 0.42 \mathrm{mmol}, 43 \%)$ m.p. $136-137^{\circ} \mathrm{C} ; \mathrm{R}_{f} 0.75$ ( $\mathrm{SiO}_{2}$, hexane:ethyl acetate $1: 1$ ); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2936,1642,1580,1505,1459,1411,1328$, $1249,1170,1028,827,712 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.75$ $\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.65\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3^{\prime}{ }^{\prime}\right.$ \& H-5'’), $6.98(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2$ ' \& H-6'), 6.99 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime \prime}$ \& H-6' $), 7.19-7.31$ ( $6 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$ \& H-2'" to H-6'’'); $\delta$ $\left.{ }^{13} \mathrm{C} \mathrm{NMR} \mathrm{(100} \mathrm{MHz;} \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 55.28\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.21\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.97\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 107.31 (s, CH), 113.77 (s, CH), 127.33 (s, C), 127.86 (s, CH), 128.98 (s, CH), 129.74 (s, CH), 132.22 ( $\mathrm{s}, \mathrm{CH}$ ), 133.31 (s, C), 137.33 (s, C), 138.58 (s, C), 140.02 (s, CH), 141.37 (s, C), 152.71 ( $\mathrm{s}, \mathrm{C}$ ), 160.27 ( $\mathrm{s}, \mathrm{C}), 196.17(\mathrm{~s}, \mathrm{C}=\mathrm{O}) ; m / z(\mathrm{AP}+) 405\left(\mathrm{MH}^{+}, 100 \%\right)$, HRMS found $[\mathrm{MH}]^{+} 405.1697$ for $\mathrm{C}_{25} \mathrm{H}_{25} \mathrm{O}_{5}, \mathrm{C}_{25} \mathrm{H}_{25} \mathrm{O}_{5}$ requires [MH] 405.1697 ; CHN found $\mathrm{C} 73.65 \%, \mathrm{H}$ 5.97\%, CHN requires C $74.24 \%$, H 5.98\%.

## Chapter 6 - Experimental

(E)-1-(3,4,5-Trimethoxyphenyl)-2,3-bis(4-methoxyphenyl)prop-2-en-1-one 173

173

The $\alpha$-arylchalcone 173 was obtained following Protocol B. Using ( $Z$ )-2-bromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one 167 ( $0.407 \mathrm{~g}, 1.0 \mathrm{mmol}$ ), 4methoxyphenylboronic acid $(0.182 \mathrm{~g}, 1.2 \mathrm{mmol})$. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3$ ) followed by recrystallization from ethyl acetate and hexane afforded 173 as yellow solid $(0.131 \mathrm{~g}, 0.30 \mathrm{mmol} 30 \%)$ m.p. $112-114^{\circ} \mathrm{C} ; \mathrm{R}_{f} 0.19\left(\mathrm{SiO}_{2}\right.$, hexane:ethyl acetate 3:1); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2937,2838,1644,1602,1578,1555,1504,1453,1413,1329,1253$, $1120,1029,1004,823 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.71\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.75(6 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), $3.76\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.66(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3$ '" \& H-5’'), 6.83 ( $2 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-3^{\prime}{ }^{\prime}$ ' \& H-5'"), 6.98 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2$ ' \& H-6'), 7.03 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ' \& H-6''), 7.13 ( $2 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-2$ '"' \& H-6'’'), 7.16 (H, s, H-3); $\delta{ }^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 55.27\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.21\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.96\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 107.29(\mathrm{~s}, \mathrm{CH}), 113.76$ (s, CH), 114.40 (s, CH), 127.56 (s, C), 129.40 (s, C), 130.95 (s, CH), 132.11 (s, CH), 133.40 (s, C), 138.26 ( $\mathrm{s}, \mathrm{C}$ ), 139.43 ( $\mathrm{s}, \mathrm{CH}$ ), 141.32 ( $\mathrm{s}, \mathrm{C}$ ), 152.70 ( $\mathrm{s}, \mathrm{C}$ ), 159.19 (s, C), 160.14 (s, C), 196.61 ( $\mathrm{s}, \mathrm{C}=\mathrm{O}$ ); $m / z(\mathrm{AP}+) 435\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 435.1799$ for $\mathrm{C}_{26} \mathrm{H}_{27} \mathrm{O}_{6}$, $\mathrm{C}_{26} \mathrm{H}_{27} \mathrm{O}_{6}$ requires $[\mathrm{MH}]^{+} 435.1802$; CHN found $\mathrm{C} 71.46 \%, \mathrm{H} 6.04 \%$, CHN requires C $71.87 \%$, H 6.03\%.
(E)-2-(2,4-Dimethoxyphenyl)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1one 174

174
The $\alpha$-arylchalcone 174 was obtained following Protocol B. Using ( 2 )-2-bromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one $167(0.407 \mathrm{~g}, 1.0 \mathrm{mmol}), 2,4-$ dimethoxyphenylboronic acid $(0.219 \mathrm{~g}, 1.2 \mathrm{mmol})$. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3$ ) followed by recrystallization from ethyl acetate and hexane afforded 174

## Chapter 6 - Experimental

as cream crystals ( $0.171 \mathrm{~g}, 0.37 \mathrm{mmol}, 37 \%$ ); m.p. $124-126{ }^{\circ} \mathrm{C} ; \mathrm{R}_{f} 0.12\left(\mathrm{SiO}_{2}\right.$, hexane:ethyl acetate 3:1); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2935,2835,1651,1580,1503,1463,1439,1412,1328$, $1303,1208,1155,1121,1008,830,766 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.59(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.78\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.81\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $6.44-6.51$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-3^{\prime} ’ ’$ \& H-5'’'), 6.73 ( $2 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-3^{\prime \prime}$ \& H-5'’), 7.07 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2$ ' \& H-6'), 7.10 ( $1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}, \mathrm{H}-6^{\prime} ’{ }^{\prime}$ ), 7.14 ( $2 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ' \& H-6' $), 7.23$ (H, s, H3); $\left.\delta{ }^{13} \mathrm{C} \mathrm{NMR} \mathrm{(100} \mathrm{MHz;} \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 55.25\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 55.39\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 55.49\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $56.15\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.93\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 99.07(\mathrm{~s}, \mathrm{CH}), 105.23$ (s, CH), 106.96 ( $\left.\mathrm{s}, \mathrm{CH}\right), 113.63$ (s, CH), 119.44 (s, C), 128.04 ( $\mathrm{s}, \mathrm{C}$ ), 131.69 ( $\mathrm{s}, \mathrm{CH}$ ), 131.75 ( $\mathrm{s}, \mathrm{CH}$ ), 133.87 (s, C), 135.42 (s, C), 139.68 ( $\mathrm{s}, \mathrm{CH}$ ), 141.00 ( $\mathrm{s}, \mathrm{C}), 152.52$ ( $\mathrm{s}, \mathrm{C}), 158.05(\mathrm{~s}, \mathrm{C}), 159.98(\mathrm{~s}, \mathrm{C}), 161.08$ (s, C), 197.09 (s, CO); $m / z(\mathrm{AP}+) 465\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 465.1901$ for $\mathrm{C}_{27} \mathrm{H}_{29} \mathrm{O}_{7}$, $\mathrm{C}_{27} \mathrm{H}_{29} \mathrm{O}_{7}$ requires $[\mathrm{MH}]^{+} 465.1908$; CHN found $\mathrm{C} 69.45 \%, \mathrm{H} 6.06 \%, \mathrm{CHN}$ requires C $69.81 \%$, H 6.08\%.
(E)-2-(4-(Dimethylamino)phenyl)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-l-one 175

175

The $\alpha$-arylchalcone 175 was obtained following Protocol B. Using ( $Z$ )-2-bromo-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one 167 ( $0.407 \mathrm{~g}, 1.0 \mathrm{mmol}$ ), 4(dimethylamino)phenylboronic acid $(0.198 \mathrm{~g}, 1.2 \mathrm{mmol})$. 181
The $\alpha$-arylchalcone 181 was obtained following Protocol B. Using ( $Z$ )-2-bromo-1-(3,4,5-trimethoxyphenyl)-3-phenylprop-2-en-1-one $178(0.337 \mathrm{~g}, 1.0 \mathrm{mmol})$, phenylboronic acid $(0.147 \mathrm{~g}, 1.2 \mathrm{mmol})$. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right)$ afforded $\mathbf{1 8 1}$ as a mixture of $E$ and $Z$ isomers as yellow oil ( $0.194 \mathrm{~g}, 0.52 \mathrm{mmol}, 52 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.44\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2936,1651,1578,1499,1447,1412,1323,1154,1000$, 764,$692 ; \delta^{l} \mathrm{H}^{\mathrm{NMR}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.77\left(14 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.81\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.86$ $\left(7 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.09-7.47(42 \mathrm{H}, \mathrm{m}, \mathrm{Ar}-\mathrm{H}) ; \delta{ }^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.15\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.22\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.92\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.98\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 107.02(\mathrm{~s}$, $\mathrm{CH}), 107.45(\mathrm{~s}, \mathrm{CH}), 126.38(\mathrm{~s}, \mathrm{CH}), 128.02(\mathrm{~s}, \mathrm{CH}), 128.17(\mathrm{~s}, \mathrm{CH}), 128.28(\mathrm{~s}, \mathrm{CH}), 128.31$ (s, CH), 128.58 (s, CH), 128.79 (s, CH), 128.92 (s, CH), 128.94 (s, CH), 129.61 (s, CH), 130.27 ( $\mathrm{s}, \mathrm{CH}$ ), 130.33 ( $\mathrm{s}, \mathrm{CH}$ ), 131.32 ( $\mathrm{s}, \mathrm{C}), 132.71$ ( $\mathrm{s}, \mathrm{C}), 134.87(\mathrm{~s}, \mathrm{C}), 135.51$ (s, C), 136.85 ( $\mathrm{s}, \mathrm{C}$ ), 138.40 ( $\mathrm{s}, \mathrm{C}$ ), 138.87 ( $\mathrm{s}, \mathrm{CH}$ ), 140.70 ( $\mathrm{s}, \mathrm{C}), 140.76$ (s, C), 142.93 ( $\mathrm{s}, \mathrm{C}$ ), 152.77 ( $\mathrm{s}, \mathrm{C}$ ), $153.10(\mathrm{~s}, \mathrm{C}), 196.11$ ( $\mathrm{s}, \mathrm{CO}$ ), 198.17 ( $\mathrm{s}, \mathrm{CO}) ; \mathrm{m} / z(\mathrm{API}-\mathrm{ES}) 375\left(\mathrm{MH}^{+}\right.$, $100 \%$ ); HRMS found [MH] ${ }^{+} 375.15914$ for $\mathrm{C}_{24} \mathrm{H}_{23} \mathrm{O}_{4}, \mathrm{C}_{24} \mathrm{H}_{23} \mathrm{O}_{4}$ requires [MH] ${ }^{+} 465.19078$.

## Chapter 6 - Experimental

(E)-1-(3,4,5-Trimethoxyphenyl)-3-(4-methoxyphenyl)-2-methylprop-2-en-1-one 182

The method adopted was that of Edwards ${ }^{72}$ et al. A solution of 1-(3,4,5-trimethoxyphenyl)propan-1-one $183\left(2.73 \mathrm{~g}, 12.2 \mathrm{mmol}\right.$ ), p-anisaldehyde ( $1.5 \mathrm{~cm}^{3}, 12.3$ mmol ), piperidine ( $7 \mathrm{~cm}^{3}$ ) and acetic acid ( $3.5 \mathrm{~cm}^{3}$ ) in ethanol ( $13 \mathrm{~cm}^{3}$ ) was heated at reflux at $110^{\circ} \mathrm{C}$ under argon for 4 days. The mixture was then cooled to room temperature and diluted with dichloromethane $\left(60 \mathrm{~cm}^{3}\right)$ and washed with water $\left(3 \times 20 \mathrm{~cm}^{3}\right)$. The aqueous fraction was then extracted with dichloromethane $\left(4 \times 50 \mathrm{~cm}^{3}\right)$. The organic fractions were then combined and dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Recrystallization from ethyl acetate and hexane afforded 182 as clear white crystals ( $1.24 \mathrm{~g}, 3.7 \mathrm{mmol}, 30 \%$ ); mp $119-12{ }^{\circ} \mathrm{C}$; Rf $0.38\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3$ ); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2996,2936,2825,1632,1604,1582,1502,1458,1412,1331,1175,1031,1015$, 821, $771 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.28\left(3 \mathrm{H}, \mathrm{d}, J 1.3 \mathrm{~Hz}, \mathrm{H}-1{ }^{\prime \prime}\right), 3.85(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.89\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.92\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.95\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right.$ ' \& H-5' $), 6.99$ ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-\mathbf{2}^{\prime} \& \mathrm{H}-6$ '), $7.17(1 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{H}-3), 7.42\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime}\right.$ ' \& H-6' $) ; \delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $14.72\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 55.38\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.30\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.99\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 106.94 (s, CH), 114.03 (s, CH), 128.33 (s, C), 131.60 (s, CH), 133.91 (s, C), 134.56 (s, C), 141.06 ( $\mathrm{s}, \mathrm{C}$ ), 141.85 ( $\mathrm{s}, \mathrm{CH}$ ), 152.80 ( $\mathrm{s}, \mathrm{C}$ ), 159.99 ( $\mathrm{s}, \mathrm{C}$ ), 198.70 ( $\mathrm{s}, \mathrm{CO}$ ); m/z(AP+) 343 $\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 343.1544$ for $\mathrm{C}_{20} \mathrm{H}_{23} \mathrm{O}_{5}, \mathrm{C}_{20} \mathrm{H}_{23} \mathrm{O}_{5}$ requires [MH] ${ }^{+}$ 343.1540; CHN found C $70.22 \%, \mathrm{H} 6.49 \%$ CHN requires C $70.16 \%, \mathrm{H} 6.48 \%$.

1-(3,4,5-Trimethoxyphenyl)propan-1-ol 184 ${ }^{388,339}$

184
A solution of bromoethane ( $3.7 \mathrm{~cm}^{3}, 49.6 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $40 \mathrm{~cm}^{3}$ ) was slowly added to a stirred mixture of magnesium turnings ( $1.46 \mathrm{~g}, 60.1 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $40 \mathrm{~cm}^{3}$ ) under argon. On consumption of the magnesium a solution of 3,4,5trimethoxybenzaldehyde ( $7.85 \mathrm{~g}, 40.0 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $40 \mathrm{~cm}^{3}$ ) was added over 30 minutes. The mixture was stirred at room temperature under argon overnight

## Chapter 6 - Experimental

and quenched by pouring carefully onto a mixture of ice and aqueous hydrochloric acid (70 $\left.\mathrm{cm}^{3}, 1 \mathrm{M}\right)$. The mixture was extracted with ethyl acetate $\left(5 \times 60 \mathrm{~cm}^{3}\right)$ The organic fraction was dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo to give $\mathbf{1 8 4}$ as a yellow oil ( $8.77 \mathrm{~g}, 38.8 \mathrm{mmol}, 97 \%$ ); $\mathrm{Rf} 0.14\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ $3448,2937,2811,2823,1590,1507,1456,1417,1326,1121,1004,830 ; \delta{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 0.91(3 \mathrm{H}, \mathrm{t}, J 7.6 \mathrm{~Hz}, \mathrm{H}-3), 1.61-1.86(2 \mathrm{H}, \mathrm{m}, \mathrm{H}-2), 2.09(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-1)$, $3.81\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.84\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.50(1 \mathrm{H}, \mathrm{t}, J 6.7 \mathrm{~Hz}, \mathrm{H}-1), 6.54(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2$ ' \& H$6^{\prime}$ ); $\delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 10.30\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 31.96\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.04\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 60.83 (s, $\mathrm{OCH}_{3}$ ), 76.18 ( $\mathrm{s}, \mathrm{CH}(\mathrm{OH})$ ), 102.67 (s, CH), 136.94 (s, C), 140.58 (s, C), 153.13 (s, C); $m / z(\mathrm{AP}+) 209\left(\mathrm{M}(-\mathrm{H} 2 \mathrm{O}) \mathrm{H}^{+}, 100 \%\right)$.

## 1-(3,4,5-Trimethoxyphenyl)propan-1-one $\mathbf{1 8 3}^{338}$

183
Pyridinium chlorochromate ( $12.93 \mathrm{~g}, 60 \mathrm{mmol}$ ) was added to a stirred solution of 1-(3,4,5-trimethoxyphenyl)propan-1-ol $184(8.70 \mathrm{~g}, 38.5 \mathrm{mmol})$ in dichloromethane ( $100 \mathrm{~cm}^{3}$ ). The reaction was then put under argon gas and stirred at room temperature under argon overnight. It was then filtered through Celite ${ }^{\otimes}$, dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:3) afforded 183 as a pale cream solid $(6.55 \mathrm{~g}, 29.3 \mathrm{mmol}, 76 \%) ; \mathrm{mp} 64-66{ }^{\circ} \mathrm{C}$; $\mathrm{Rf} 0.32\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3$ ); $v_{\text {max }} .\left(\mathrm{cm}^{-1}\right) 3004,2968,2939,2839,1673,1586,1505,1454,1411$, $1309,1157,1123,857,799 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $1.21(3 \mathrm{H}, \mathrm{t}, J 7.2 \mathrm{~Hz}, \mathrm{H}-3)$, $2.97(2 \mathrm{H}, \mathrm{q}, J 7.2 \mathrm{~Hz}, \mathrm{H}-2), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.21(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2$ ' \& H$\left.6^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 8.44\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 31.59\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.28\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $60.96\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 105.40(\mathrm{~s}, \mathrm{CH}), 132.24$ (s, C), 142.33 (s, C), 153.04 (s, C), 199.65 (s, CO); $m / z(\mathrm{AP}+) 225\left(\mathrm{MH}^{+}, 100 \%\right)$.

1-(3,4,5-Trimethoxyphenyl)-3-(4-methoxyphenyl)propan-1-one 185

## Chapter 6 - Experimental

(E)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one 165 ( $2.09 \mathrm{~g}, 6.4 \mathrm{mmol}$ ) in ethyl acetate $\left(40 \mathrm{~cm}^{3}\right)$ was added to a stirring activated suspension of $10 \% \mathrm{Pd} / \mathrm{C}$ ( 1 spatula) in ethyl acetate $\left(10 \mathrm{~cm}^{3}\right)$. The mixture was stirred at room temperature under a hydrogen atmosphere for 3 hours, filtered through celite and evaporated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}\right.$ hexane:ethyl acetate $\left.3: 1\right)$ afforded $\mathbf{1 8 5}$ as white crystals (1.72 g, $5.2 \mathrm{mmol}, 82 \%$ ); m.p. $88-90^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.46\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ 3006, 2964, 2939, 2834, 1673, 1615, 1585, 1514, 1503, 1482, 1451, 1411, 1323, 1247, 1151, $1033,1007,816,762 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.00(2 \mathrm{H}, \mathrm{t}, J 7.6 \mathrm{~Hz}, \mathrm{H}-3), 3.23$ $(2 \mathrm{H}, \mathrm{t}, J 7.6 \mathrm{~Hz}, \mathrm{H}-2), 3.79\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.85(2 \mathrm{H}$,
 $\delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 29.50\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 40.67\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 55.30\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.29$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 60.98\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 105.42(\mathrm{~s}, \mathrm{CH}), 113.96(\mathrm{~s}, \mathrm{CH}), 129.43(\mathrm{~s}, \mathrm{CH}), 132.19(\mathrm{~s}, \mathrm{C})$, 133.33 ( $\mathrm{s}, \mathrm{C}$ ), 142.44 ( $\mathrm{s}, \mathrm{C}$ ), 153.05 ( $\mathrm{s}, \mathrm{C}$ ), 158.03 ( $\mathrm{s}, \mathrm{C}$ ), 198.19 ( $\mathrm{s}, \mathrm{CO}$ ); m/z(AP+) 331 $\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 331.1537$ for $\mathrm{C}_{19} \mathrm{H}_{23} \mathrm{O}_{5}, \mathrm{C}_{19} \mathrm{H}_{23} \mathrm{O}_{5}$ requires [MH] ${ }^{+}$ 331.1540.

1-(3,4,5-Trimethoxyphenyl)-3-phenylpropan-1-one 186

186
(E)-1-(3,4,5-trimethoxyphenyl)-3-phenylprop-2-en-1-one $179(3.00 \mathrm{~g}, 10.1 \mathrm{mmol})$ in ethyl acetate $\left(50 \mathrm{~cm}^{3}\right.$ ) was added to a stirring activated suspension of $10 \% \mathrm{Pd} / \mathrm{C}$ ( 1 spatula) in ethyl acetate $\left(10 \mathrm{~cm}^{3}\right)$. The mixture was stirred at room temperature under a hydrogen atmosphere for 3 hours, filtered through celite and evaporated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}\right.$ hexane:ethyl acetate 3:1) afforded 186 as an off white solid ( 2.87 g , $9.6 \mathrm{mmol}, 95 \%) ;$ m.p. $90-91^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.45\left(\mathrm{SiO}_{2}\right.$ hexane:ethyl acetate $\left.3: 1 \mathrm{v} / \mathrm{v}\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ 2998, 2940, 2839, 1674, 1583, 1501, 1465, 1452, 1411, 1324, 1001, 712; $\delta{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.06(2 \mathrm{H}, \mathrm{t}, J 7.6 \mathrm{~Hz}, \mathrm{H}-3), 3.27(2 \mathrm{H}, \mathrm{t}, J 7.6 \mathrm{~Hz}, \mathrm{H}-2), 3.89(6 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), $3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.20\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-\mathbf{2}^{\prime} \& \mathrm{H}-6\right.$ '), $7.21-7.34$ ( $5 \mathrm{H}, \mathrm{m}, \mathrm{H}-\mathbf{2}^{\prime}$ ' to H-6' '); $\delta^{13} \mathrm{C}\left(100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right), 30.36\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 40.42\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.30\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.99(\mathrm{~s}$, $\mathrm{OCH}_{3}$ ), $105.40(\mathrm{~s}, \mathrm{CH}), 126.23$ (s, CH), 128.52 (s, CH), $128.60(\mathrm{~s}, \mathrm{CH}), 132.14(\mathrm{~s}, \mathrm{C}), 141.35$ (s, C), 142.45 ( $\mathrm{s}, \mathrm{C}$ ), 153.06 ( $\mathrm{s}, \mathrm{C}$ ), 198.04 ( $\mathrm{s}, \mathrm{CO}$ ); $m / z\left(\mathrm{AP}+\right.$ ) $301\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found [MH] ${ }^{+} 301.14398$ for $\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{O}_{4}, \mathrm{C}_{18} \mathrm{H}_{21} \mathrm{O}_{4}$ requires [ MH$]^{+}$301.14344.

Chapter 6 - Experimental
(E)-3-(3-Hydroxy-4-methoxyphenyl)-2-(4-methoxyphenyl)acrylic acid 191

191
The method adopted was that of Borrel ${ }^{92}$ et al. A mixture of 4-methoxyphenylacetic acid $(1.66 \mathrm{~g}, 10.0 \mathrm{mmol})$, 3-hydroxy-4-methoxybenzaldehyde ( $0.76 \mathrm{~g}, 5.0 \mathrm{mmol}$ ) and triethylamine $\left(2.3 \mathrm{~cm}^{3}, 16.5 \mathrm{mmol}\right)$ in acetic anhydride ( $4.5 \mathrm{~cm}^{3}$ ) under argon was heated to $140^{\circ} \mathrm{C}$ for 3 hours. The mixture was then cooled to room temperature and was acidified with concentrated hydrochloric acid $\left(6.9 \mathrm{~cm}^{3}\right)$. The mixture was then stirred overnight at room temperature allowing the product to precipitate. The cream precipitate was then filtered off and recrystallization from ethanol afforded 191 as cream crystals ( $0.56 \mathrm{~g}, 1.9 \mathrm{mmol}, 37 \%$ ); m.p. $207-209{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.16\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3323,2939,2847$, $1661,1598,1509,1434,1268,1241,1133,800 ; \delta{ }^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) $3.71\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.77\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.48(1 \mathrm{H}, \mathrm{d}, J 1.7 \mathrm{~Hz}, \mathrm{H}-2$ '’), $6.55(2 \mathrm{H}, \mathrm{d}, J 1.7,8.7$ $\mathrm{Hz}, \mathrm{H}-6$ ' $), 6.76\left(1 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-5{ }^{\prime \prime}\right), 6.92\left(2 \mathrm{H}, \mathrm{d}, J 9.0 \mathrm{~Hz}, \mathrm{H}-3^{\prime} \& \mathrm{H}^{\prime} 5^{\prime}\right), 7.05(2 \mathrm{H}, \mathrm{d}, J$ $9.0 \mathrm{~Hz}, \mathrm{H}-2$ ' \& H-6'), $7.56(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3), 8.91\left(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-3^{\prime}\right)$ ), $12.41\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{H}-1\right) ; \delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{d} 6-\mathrm{DMSO} ; \mathrm{ppm}) 55.71\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.17\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 122.22(\mathrm{~s}, \mathrm{CH}), 114.63$ (s, CH), 117.84 (s, CH), 123.41 (s, CH), 128.01 (s, C), 129.29 (s, C), 130.86 (s, C), 131.41 (s, CH ), 139.66 ( $\mathrm{s}, \mathrm{CH}$ ), 146.54 ( $\mathrm{s}, \mathrm{C}$ ), 149.36 ( $\mathrm{s}, \mathrm{C}$ ), 159.20 ( $\mathrm{s}, \mathrm{C}$ ), 169.57 ( $\mathrm{s}, \mathrm{CO}_{2} \mathrm{H}$ ); m/z(API$\mathrm{ES}+) 301\left([\mathrm{MH}]^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 301.10765$ for $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{O}_{5}, \mathrm{C}_{17} \mathrm{H}_{17} \mathrm{O}_{5}$ requires [MH] ${ }^{+} 301.10705$.

5-((E)-2-(Chlorocarbonyl)-2-(4-methoxyphenyl)vinyl)-2-methoxyphenyl acetate 198

198
The method adopted was that of Hosoda ${ }^{205}$ et al. To a stirred suspension of (E)-3-(3-acetoxy-4-methoxyphenyl)-2-(4-methoxyphenyl)acrylic acid 196 ( $0.38 \mathrm{~g}, 1.1 \mathrm{mmol}$ ) in dry chloroform and anhydrous dimethyl formamide ( 1 drop) under argon was added thionyl chloride $\left(0.1 \mathrm{~cm}^{3}, 1.4 \mathrm{mmol}\right)$. The mixture was then heated to reflux at $75{ }^{\circ} \mathrm{C}$ for 4 hours.

## Chapter 6 - Experimental

The solvent was then removed at evaporated in vacuo at $80^{\circ} \mathrm{C}$ to afford 198 as a thick yellow brown oil ( $0.37 \mathrm{~g}, 1.0 \mathrm{mmol}, 93 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.17\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ $2937,2841,1765,1735,1601,1571,1508,1462,1439,1274,1195,1071,1020,813 ; \delta{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 2.26(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2 ’ ’), 3.81\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $6.79\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 6.80\left(1 \mathrm{H}, \mathrm{d}, J 2.3 \mathrm{~Hz}, \mathrm{H}-2^{\prime}{ }^{\prime}\right), 6.96\left(2 \mathrm{H}, \mathrm{d}, J 9.2 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right.$ \& H$\left.5^{\prime}\right), 6.98\left(1 \mathrm{H}, \mathrm{dd}, J 2.3,8.4 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right), 7.14(2 \mathrm{H}, \mathrm{d}, J 9.2 \mathrm{~Hz}, \mathrm{H}-2$ ' \& H-6'), 7.99 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3$ ); $\delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 20.55\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 55.33\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 55.95\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 111.98 (s, CH), 114.73 ( $\mathrm{s}, \mathrm{CH}$ ), 126.08 ( $\mathrm{s}, \mathrm{CH}$ ), 126.56 ( $\mathrm{s}, \mathrm{C}), 126.78$ ( $\mathrm{s}, \mathrm{C}), 130.82$ ( $\mathrm{s}, \mathrm{CH}$ ), 131.02 (s, CH), 134.09 (s, C), 139.42 (s, C), 146.57 (s, CH), 153.10 (s, C), 159.88 (s, C), 168.63 (s, CO), 169.40 (s, CO).
(E)-3-(3-Acetoxy-4-methoxyphenyl)-2-(4-methoxyphenyl)acrylic acid 196

196
A mixture of 4-methoxyphenylacetic acid ( $1.66 \mathrm{~g}, 10.0 \mathrm{mmol}$ ), 3-hydroxy-4methoxybenzaldehyde ( $0.76 \mathrm{~g}, 5.0 \mathrm{mmol}$ ) and triethylamine ( $2.3 \mathrm{~cm}^{3}, 16.5 \mathrm{mmol}$ ) in acetic anhydride ( $4.5 \mathrm{~cm}^{3}$ ) was sealed in a pressure-rated reaction vial $\left(10 \mathrm{~cm}^{3}\right)$. The reaction vial was then irradiated in a self-turning single-mode CEM Discovery ${ }^{\text {TM }}$ Focused Synthesizer. The reaction was maintained at $170^{\circ} \mathrm{C}$ (power: 200 W ) for 25 minutes. The mixture was then rapidly cooled to room temperature. The solvent was evaporated in vacuo using a gene vac. The residue was then dissolved in ethyl acetate $\left(50 \mathrm{~cm}^{3}\right)$, washed with water ( $3 \times 20 \mathrm{~cm}^{3}$ ), dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 9$ to $\left.1: 1\right)$ followed by recrystallization from ethyl acetate and hexane afforded 196 as white crystals ( $0.67 \mathrm{~g}, 1.9 \mathrm{mmol}, 39 \%$ ); m.p. 163 $165{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.26\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2967,2933,2837,2624,1769$, $1734,1687,1666,1606,1575,1504,1468,1431,1244,1201,1173,1123,1031,815,772 ; \delta$ ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) 2.17 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{`}{ }^{\prime \prime}$ ), $3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.76(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 6.78\left(1 \mathrm{H}, \mathrm{d}, J 1.9 \mathrm{~Hz}, \mathrm{H}-2^{\prime}{ }^{\prime}\right), 6.91\left(1 \mathrm{H}, \mathrm{dd}, J 1.9,9.1 \mathrm{~Hz}, \mathrm{H}-6^{\prime \prime}\right), 6.93(2 \mathrm{H}, \mathrm{d}, J 8.6$ $\left.\mathrm{Hz}, \mathrm{H}-3^{\prime} \& \mathrm{H}-5^{\prime}\right), 6.96\left(1 \mathrm{H}, \mathrm{d}, J 9.1 \mathrm{~Hz}, \mathrm{H}-5^{\prime \prime}\right), 7.06(2 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-2$ ' \& H-6'), 7.62 $(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3), 12.52\left(1 \mathrm{H}\right.$, br. s, $\left.\mathrm{CO}_{2} \mathrm{H}-1\right) ; \delta{ }^{13} \mathrm{C}$ NMR ( 100 MHz ; d6-DMSO; ppm) 20.94 (s, $\left.\mathrm{CH}_{3}\right), 55.79\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.58\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 113.19(\mathrm{~s}, \mathrm{CH}), 114.80(\mathrm{~s}, \mathrm{CH}), 125.43(\mathrm{~s}, \mathrm{CH})$, 128.01 (s, C), 128.96 (s, C), 129.72 (s, CH), 131.35 ( $\mathrm{s}, \mathrm{CH}$ ), 132.12 ( $\mathrm{s}, \mathrm{C}), 138.32$ ( $\mathrm{s}, \mathrm{CH}$ ),

## Chapter 6 - Experimental

139.49 ( $\mathrm{s}, \mathrm{C}$ ), 152.08 ( $\mathrm{s}, \mathrm{C}$ ), 159.38 ( $\mathrm{s}, \mathrm{C}$ ), 168.94 ( $\mathrm{s}, \mathrm{CO}_{2} \mathrm{H}$ ), 169.31 ( $\mathrm{s}, \mathrm{CO}$ ); m/z(API-ES +) 342 ( $[\mathrm{MH}]^{+}, 100 \%$ ); HRMS found $[\mathrm{MH}]^{+} 343.11800$ for $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{6}, \mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{6}$ requires [MH] ${ }^{+}$ 343.11761 .

5-((E)-2-(N-Methoxy-N-methylcarbamoyl)-2-(4-methoxyphenyl)vinyl)-2-methoxyphenyl acetate 199

199

The method adopted was that of $\mathrm{Nahm}^{206}$ et al. To a stirred mixture of 5-((E)-2-(chlorocarbonyl)-2-(4-methoxyphenyl)vinyl)-2-methoxyphenyl acetate 198 (0.36 g, 1.0 mmol ) and $N, O$-dimethylhydroxyamine hydrochloride ( $0.11 \mathrm{~g}, 1.2 \mathrm{mmol}$ ) in dry chloroform $\left(10 \mathrm{~cm}^{3}\right)$ under argon at $0^{\circ} \mathrm{C}$ was added pyridine $\left(0.2 \mathrm{~cm}^{3}, 2.6 \mathrm{mmol}\right)$. The mixture was then at room temperature for 1 hour. The solvent was then evaporated in vacuo, the residue as then dissolved in dichloromethane $\left(10 \mathrm{~cm}^{3}\right)$ and washed with water $\left(3 \times 10 \mathrm{~cm}^{3}\right)$. The aqueous faction was then extracted with dichloromethane $\left(2 \times 10 \mathrm{~cm}^{3}\right)$, the organic fractions were then combined, then dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane $1: 1$ ) afforded 199 as a pale yellow oil ( $0.27 \mathrm{~g}, 0.7 \mathrm{mmol}, 70 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.30\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right)$; $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ 2936, 2840, 1765, 1643, 1607, 1573, 1508, 1460, 1442, 1268, 1246, 1175, 1124, 1109, 1020, 836; $\delta^{1}{ }^{\prime} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.25(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2 ’ ’), 3.20\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NOCH}_{3}-1{ }^{\prime}{ }^{\prime \prime \prime}\right)$, $3.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}-1{ }^{\prime} \cdot ’\right), 3.78\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.82\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.75(1 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-$ $5^{\prime}$ ), $6.79\left(1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right)$ ), $6.81(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3), 6.86\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3^{\prime} \& \mathrm{H}-5^{\prime}\right)$, $6.95\left(1 \mathrm{H}, \mathrm{dd}, J 2.0,8.5 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right), 7.23\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-2^{\prime} \& \mathrm{H}-6^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR (100 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 20.85\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 33.75\left(\mathrm{~s}, \mathrm{NCH}_{3}\right), 55.47\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.03\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 60.85(s, $\mathrm{OCH}_{3}$ ), $112.00(\mathrm{~s}, \mathrm{CH}), 114.34(\mathrm{~s}, \mathrm{CH}), 124.34(\mathrm{~s}, \mathrm{CH}), 128.45,128.55,128.67(\mathrm{~s}$, CH), 130.50 (s, CH), 130.94 ( $\mathrm{s}, \mathrm{CH}$ ), 136.03 (s, C), 139.41 (s, C), 150.98 (s, C), 159.42 (s, C), 169.01 ( $\mathrm{s}, \mathrm{CO}$ ), $172.31(\mathrm{~s}, \mathrm{CO}) ; m / z($ API-ES + $) 386$ ([MH] ${ }^{+}, 100 \%$ );HRMS found $[\mathrm{MH}]^{+}$ 386.16039 for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{O}_{6} \mathrm{~N}, \mathrm{C}_{21} \mathrm{H}_{24} \mathrm{O}_{6} \mathrm{~N}$ requires $[\mathrm{MH}]^{+} 386.15981$.

203
A mixture 5-bromo-1,2,3-trimethoxybenzene ( $0.500 \mathrm{~g}, 2.02 \mathrm{mmol}$ ) in anhydrous ether (4 $\mathrm{cm}^{3}$ ) was slowly added to n-butyllithium in hexane ( $2.5 \mathrm{~cm}^{3}, 1.6 \mathrm{M}$ ) in anhydrous ether (30 $\mathrm{cm}^{3}$ ) under argon at $-78^{\circ} \mathrm{C}$. The mixture was then stirred for an hour at $-78^{\circ} \mathrm{C}$, to make a milky white solution of $3,4,5$-trimethoxyphenyl lithium. A portion of the 3,4,5trimethoxyphenyl lithium in ether $\left(20 \mathrm{~cm}^{3}\right)$ was then added slowly to a mixture of 5-( $(E)$-2( N -methoxy-N-methylcarbamoyl)-2-(4-methoxyphenyl)vinyl)-2-methoxyphenyl acetate 199 $(0.183 \mathrm{~g}, 0.47 \mathrm{mmol})$ in anhydrous tetrahydrofuran $\left(10 \mathrm{~cm}^{3}\right)$ under argon at $-78{ }^{\circ} \mathrm{C}$. The reaction was then stirred at $-78^{\circ} \mathrm{C}$ for 1 hour, before being allowed to warm to room temperature and being stirred overnight. Any excess lithium reagent was then quenched by adding methanol $\left(0.5 \mathrm{~cm}^{3}\right)$ to the mixture. The mixture was then washed with water $(3 \times 10$ $\mathrm{cm}^{3}$ ) and the aqueous layer was extracted with ethyl acetate ( $4 \times 20 \mathrm{~cm}^{3}$ ). The organic fractions were then combined, dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 19$ to $\left.1: 1\right)$ afforded 203 as a yellow residue ( $0.094 \mathrm{~g}, 0.27 \mathrm{mmol}, 58 \%$ ); m.p. $54-55^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.30\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 1) ; \quad v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 3352,2961,2935,1631,1606,1578,1508,1459,1440$, $1415,1275,1244,1175,1022,836,797,762 ; \delta^{\prime} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.20(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{NOCH}_{3}-1{ }^{\prime \prime \prime}\right), 3.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NCH}_{3}-1\right.$ ''' $), 3.82\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.44(1 \mathrm{H}$, $\mathrm{s}, \mathrm{OH}-3 '$ '), 6.63 ( 1 H , dd, $J 1.7,8.5 \mathrm{~Hz}, \mathrm{H}-6 ’$ '), $6.66(1 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-5 ’$ '), 6.71 ( $1 \mathrm{H}, \mathrm{d}, J$
 H-2' \& H-6'); $\left.\delta^{13} \mathrm{C} \mathrm{NMR} \mathrm{(100} \mathrm{MHz;} \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 33.81\left(\mathrm{~s}, \mathrm{NCH}_{3}\right), 55.41\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.03$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 60.79\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 110.42(\mathrm{~s}, \mathrm{CH}), 114.24(\mathrm{~s}, \mathrm{CH}), 115.94(\mathrm{~s}, \mathrm{CH}), 122.55(\mathrm{~s}, \mathrm{CH})$, 128.70 ( $\mathrm{s}, \mathrm{C}$ ), 129.00 ( $\mathrm{s}, \mathrm{C}$ ), 130.53 ( $\mathrm{s}, \mathrm{CH}$ ), 132.06 ( $\mathrm{s}, \mathrm{CH}$ ), 135.41 ( $\mathrm{s}, \mathrm{C}), 145.28$ (s, C), 146.74 (s, C), 159.33 (s, C), 172.55 (s, CO); m/z(API-ES +) 344 ([MH] ${ }^{+}, 100 \%$ ); HRMS found $[\mathrm{MH}]^{+} 344.15096$ for $\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{O}_{5} \mathrm{~N}, \mathrm{C}_{19} \mathrm{H}_{22} \mathrm{O}_{5} \mathrm{~N}$ requires [MH] ${ }^{+} 344.14925$.

## Chapter 6 - Experimental

(E)-3-(3-Hydroxy-4-methoxyphenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one 117 ${ }^{73}$

117
To a stirring mixture of 3,4,5-trimethoxyacetophenone ( $2.51 \mathrm{~g}, 11.9 \mathrm{mmol}$ ) and 3-hydroxy-4methoxybenzaldehyde ( $1.81 \mathrm{~g}, 11.9 \mathrm{mmol}$ ) in methanol ( $10 \mathrm{~cm}^{3}$ ) was added an aqueous sodium hydroxide solution $\left(4.0 \mathrm{~cm}^{3}, 12 \mathrm{M}\right)$. The mixture was then stirred overnight at room temperature forming a red solution; the mixture was then acidified with aqueous hydrochloric acid ( 1 M ) till the $\mathrm{pH} \sim 5-6$, solution turns yellow. The mixture was then extracted with chloroform ( $4 \times 25 \mathrm{~cm}^{3}$ ), the organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Recrystallization from methanol afforded 117 as yellow crystals ( $2.83 \mathrm{~g}, 8.2 \mathrm{mmol}, 69 \%$ ); mp $150-151{ }^{\circ} \mathrm{C}$; Rf $0.32\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 1) ; v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 3398,3003,2935,2837,1652,1571,1507,1453,1414$, $1244,1233,1127,990,813 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.92\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94$ ( $6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ), $5.81\left(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-3^{\prime \prime}\right), 6.86\left(1 \mathrm{H}, \mathrm{d}, J 8.2 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right)$ ), $7.12(1 \mathrm{H}, J 2.0,8.2 \mathrm{~Hz}, \mathrm{H}-$ $6^{\prime \prime}$ ), 7.26 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{\prime} \& \mathrm{H}-6^{\prime}$ ), 7.30 ( $1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime}$ ), 7.34 ( $1 \mathrm{H}, \mathrm{d}, \mathrm{J} 15.4 \mathrm{~Hz}, \mathrm{H}-2$ ), $7.74(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 15.4 \mathrm{~Hz}, \mathrm{H}-3) ; \delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $56.06\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.38(\mathrm{~s}$, $\left.\mathrm{OCH}_{3}\right), 61.02\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 105.87(\mathrm{~s}, \mathrm{CH}), 110.57(\mathrm{~s}, \mathrm{CH}), 112.70(\mathrm{~s}, \mathrm{CH}), 119.80(\mathrm{~s}, \mathrm{CH})$, 123.10 (s, CH), 128.52 (s, C), 133.76 (s, C), 142.24 (s, C), 144.73 (s, CH), 145.89 (s, C), 148.86 (s, C), 153.13 (s, C), 189.15 (s, CO); CHN found C 66.17\%, H 5.88\%, CHN requires C 66.27\%, H 5.85\%.

## Anhydrous Trifluoroacetic acid

The method adopted was that of Armarego ${ }^{223}$ et al. Trifluoroacetic acid ( $25 \mathrm{~cm}^{3}$ ) stirred over phosphorus pentoxide ( 5.2 g ) for 12 hours under an atmosphere of argon, followed by distillation (bp $74-75^{\circ} \mathrm{C} / 1 \mathrm{~atm}$.).

## Protocol C

The chalcone was dissolved in anhydrous trifluoroacetic acid and sealed in a pressure-rated reaction vial $\left(10 \mathrm{~cm}^{3}\right)$. The reaction tube was irradiated in a self-turning single-mode CEM Discovery ${ }^{\mathrm{TM}}$ Focused Synthesizer. The reaction was maintained at $120^{\circ} \mathrm{C}$ (power: 100 W ) for 20 minutes. The mixture was then rapidly cooled to room temperature and poured into water, extracted with ethyl acetate. The organic fraction was then washed with saturated

## Chapter 6 - Experimental

aqueous sodium bicarbonate solution, dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. The crude indanone was purified by means of column chromatography.

## 2,3-Dihydro-4,5,6-trimethoxy-3-(4-methoxyphenyl)inden-1-one 205

205
The method adopted was that of Rice ${ }^{215}$ et al. In a sealed tube (E)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one $165(2.25 \mathrm{~g}, 6.9 \mathrm{mmol})$ was dissolved in anhydrous trifluoroacetic acid $\left(13 \mathrm{~cm}^{3}\right)$. The sealed tube is then heated to 120 ${ }^{\circ} \mathrm{C}$ for 4 hours. Once the reaction had cooled to room temperature it was tipped into cold water ( $30 \mathrm{~cm}^{3}$ ), and then extracted with ethyl acetate $\left(5 \times 30 \mathrm{~cm}^{3}\right)$. The organic fraction was then washed with saturated aqueous sodium bicarbonate solution $\left(30 \mathrm{~cm}^{3}\right)$, brine $\left(30 \mathrm{~cm}^{3}\right)$, dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right)$ afforded 205 as a cream solid ( $1.63 \mathrm{~g}, 5.0$ mmol, $72 \%$.

The indanone 205 was obtained following Protocol C. Using (E)-1-(3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one $165(0.99 \mathrm{~g}, 6.9 \mathrm{mmol})$ in anhydrous trifluoroacetic acid ( $1 \mathrm{~cm}^{3}$ ). Tipped into water ( $10 \mathrm{~cm}^{3}$ ), extracted with ethyl acetate ( $2 \times 10 \mathrm{~cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution $\left(10 \mathrm{~cm}^{3}\right)$. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:3) afforded 205 as a cream solid ( $0.59 \mathrm{~g}, 1.8 \mathrm{mmol}, 60 \%$ ); m.p. $66-67^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.35\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2967,2938,2836,1706$, $1610,1594,1512,1470,1456,1417,1429,1417,1340,1303,1248,1177,1125,1091,1025$, 830; $\delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.59(1 \mathrm{H}, \mathrm{dd}, J 2.4,19.2 \mathrm{~Hz}, \mathrm{H}-2), 3.19(1 \mathrm{H}, \mathrm{dd}, J$ $7.6,19.2 \mathrm{~Hz}, \mathrm{H}-2), 3.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.77\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 4.54(1 \mathrm{H}, \mathrm{dd}, J 2.4,7.6 \mathrm{~Hz}, \mathrm{H}-3), 6.81(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3$ ' \& H-5'), $7.02(2 \mathrm{H}, \mathrm{d}, J$ $\left.8.8 \mathrm{~Hz}, \mathrm{H}-2^{\prime} \& \mathrm{H}-6^{\prime}\right), 7.08(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 40.89(\mathrm{~s}, \mathrm{CH})$, $47.33\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 55.26\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.25\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.14\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.92\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 100.31$ (s, CH), 113.97 ( $\mathrm{s}, \mathrm{CH}$ ), 128.23 ( $\mathrm{s}, \mathrm{CH}$ ), 132.00 ( $\mathrm{s}, \mathrm{C}$ ), 136.27 ( $\mathrm{s}, \mathrm{C}$ ), 145.17 ( $\mathrm{s}, \mathrm{C}$ ), 148.98 ( s , C), $150.35(\mathrm{~s}, \mathrm{C}), 154.86(\mathrm{~s}, \mathrm{C}), 158.27(\mathrm{~s}, \mathrm{C}), 206.19(\mathrm{~s}, \mathrm{CO}) ; m / z(\mathrm{AP}+) 329\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found [MH] ${ }^{+} 329.13853$ for $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{O}_{5}, \mathrm{C}_{19} \mathrm{H}_{21} \mathrm{O}_{5}$ requires $[\mathrm{MH}]^{+} 329.13835$.

## Chapter 6 - Experimental

2,3-Dihydro-3-(3-hydroxy-4-methoxyphenyl)-4,5,6-trimethoxyinden-1-one 153

153
The indanone 153 was obtained following Protocol C. Using (E)-3-(3-hydroxy-4-methoxyphenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one 117 ( $0.92 \mathrm{~g}, 2.7 \mathrm{mmol}$ ) in anhydrous trifluoroacetic acid $\left(1 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(10 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 15 \mathrm{~cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution $\left(10 \mathrm{~cm}^{3}\right)$. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3) afforded 153 as brown solid ( 0.51 $\mathrm{g}, 1.5 \mathrm{mmol}, 56 \%) ;$ m.p. $116-117{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.36\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\max }\left(\mathrm{cm}^{-1}\right)$ $3253,2959,2835,1693,1586,1509,1463,1417,1270,1215,1130,1096,1024,806 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.57(1 \mathrm{H}, \mathrm{dd}, J 2.5,19.3 \mathrm{~Hz}, \mathrm{H}-2), 3.15(1 \mathrm{H}, \mathrm{dd}, J 7.9,19.3$ $\mathrm{Hz}, \mathrm{H}-2), 3.42\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $4.50(1 \mathrm{H}, \mathrm{dd}, J 2.5,7.9 \mathrm{~Hz}, \mathrm{H}-3), 5.56(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-3 '), 6.61(1 \mathrm{H}, \mathrm{dd}, J 2.0,8.3 \mathrm{~Hz}, \mathrm{H}-6$ '), 6.63 ( $1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ), $6.75\left(1 \mathrm{H}, \mathrm{d}, J 8.3 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 7.07(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7) ; \delta^{13} \mathrm{C}$ NMR ( 100 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 41.04(\mathrm{~s}, \mathrm{CH}), 47.32\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 55.95\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.27\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.18$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 60.94\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 100.26(\mathrm{~s}, \mathrm{CH}), 110.55(\mathrm{~s}, \mathrm{CH}), 113.32(\mathrm{~s}, \mathrm{CH}), 118.72(\mathrm{~s}, \mathrm{CH})$, 132.19 (s, C), 137.69 (s, C), 144.66 (s, C), 145.23 (s, C), 145.66 (s, C), 148.79 (s, C), 150.40 (s, C), $154.85(\mathrm{~s}, \mathrm{C}), 205.54(\mathrm{~s}, \mathrm{C}=\mathrm{O}) ; \mathrm{m} / \mathrm{z}(\mathrm{AP}+) 345\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+}$ 345.13353 for $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{O}_{6}, \mathrm{C}_{19} \mathrm{H}_{21} \mathrm{O}_{6}$ requires $[\mathrm{MH}]^{+} 345.13326$.
(E)-3-(4-Chlorophenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one 206

206
The chalcone 206 was obtained following Protocol A. Using 3,4,5-trimethoxyacetophenone $(2.10 \mathrm{~g}, 10.0 \mathrm{mmol})$, 4-chlorobenzaldehyde $(1.41 \mathrm{~g}, 10.0 \mathrm{mmol})$ and aqueous sodium hydroxide solution ( $1.7 \mathrm{~cm}^{3}, 12 \mathrm{M}$ ) in methanol $\left(5 \mathrm{~cm}^{3}\right)$. Recrystallization from methanol afforded 51 as light yellow crystals ( $1.87 \mathrm{~g}, 5.6 \mathrm{mmol}, 55 \%$ ); m.p. $115-116{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.50\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\max }\left(\mathrm{cm}^{-1}\right) 2936,2837,1655,1579,1505,1490,1455,1410,1323$,

## Chapter 6 - Experimental

1157, 1090, 1001, 809; $\delta^{\mathrm{l}} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89(6 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), 7.20 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{\prime}$ \& H-6'), 7.33 ( $2 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-3^{\prime}$ ' \& H-5''), 7.39 ( $1 \mathrm{H}, \mathrm{d}, J 15.6$ $\mathrm{Hz}, \mathrm{H}-2), 7.52(2 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-2$ '' \& H-6' $), 7.70(1 \mathrm{H}, \mathrm{d}, J 15.6 \mathrm{~Hz}, \mathrm{H}-3) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.43\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.05\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.04(\mathrm{~s}, \mathrm{CH}), 122.08(\mathrm{~s}, \mathrm{CH})$, 129.28 (s, CH), 129.64 (s, CH), 133.32 (s, C), 133.36 (s, C), 136.47 (s, C), 142.57 (s, C), 143.30 (s, CH), 153.19 (s, C), 188.94 (s, CO); $m / z(\mathrm{AP}+) 333\left(\mathrm{MH}^{+}, 100 \%\right), 335\left(\mathrm{MH}^{+}\right.$, $25 \%$ ); HRMS found [MH] 333.0887 for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Cl}, \mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Cl}$ requires [ MH$]^{+} 333.0888$; CHN found C $64.88 \%$, H $5.11 \%$ CHN requires C $64.97 \%$, H $5.15 \%$.

The chalcone 220 was obtained following Protocol A. Using 3,4,5-trimethoxyacetophenone ( $0.51 \mathrm{~g}, 2.4 \mathrm{mmol}$ ), 3,5 -dimethoxybenzaldehyde ( $0.42 \mathrm{~g}, 2.4 \mathrm{mmol}$ ) and aqueous sodium hydroxide solution ( $1.2 \mathrm{~cm}^{3}, 4 \mathrm{M}$ ) in methanol $\left(2.5 \mathrm{~cm}^{3}\right)$. Recrystallization from methanol afforded 220 as yellow crystals ( $0.72 \mathrm{~g}, 2.0 \mathrm{mmol}, 83 \%$ ); m.p. $107-109^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.50\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2947,2839,1648,1589,1570,1507,1461,1416,1334$, 1160,$827 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.83\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.94\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.52(1 \mathrm{H}, \mathrm{t}, J 2.3 \mathrm{~Hz}, \mathrm{H}-4), 6.77\left(2 \mathrm{H}, \mathrm{d}, J 2.3 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime \prime}\right.$ \& H-6’), 7.25 (2H, s, H-2’ \& H-6'), $7.41(1 \mathrm{H}, \mathrm{d}, J 15.6 \mathrm{~Hz}, \mathrm{H}-2), 7.71(1 \mathrm{H}, \mathrm{d}, J 15.6 \mathrm{~Hz}, \mathrm{H}-3) ; \delta^{13} \mathrm{C}$ ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 55.72\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.65\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.22\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 102.68(\mathrm{~s}, \mathrm{CH})$, 106.39 (s, CH), 106.69 ( $\mathrm{s}, \mathrm{CH}$ ), 122.59 ( $\mathrm{s}, \mathrm{CH}$ ), 133.65 ( $\mathrm{s}, \mathrm{C}$ ), 137.02 ( $\mathrm{s}, \mathrm{C}), 142.77$ (s, C), 144.98 (s, CH), 153.38 ( $\mathrm{s}, \mathrm{C}$ ), 161.29 ( $\mathrm{s}, \mathrm{C}$ ), 189.54 (s, CO); m/z(API ES+) 359 ( $\mathrm{MH}^{+}$, $100 \%$ ); HRMS found $[\mathrm{MH}]^{+} 359.15056$ for $\mathrm{C}_{20} \mathrm{H}_{23} \mathrm{O}_{6}, \mathrm{C}_{20} \mathrm{H}_{23} \mathrm{O}_{6}$ requires [MH] ${ }^{+} 359.14891$.

## 4-(Benzyloxy)benzaldehyde $\mathbf{2 2 1}^{342}$

221

To a stirring mixture of 4-hydroxybenzaldehyde ( $1.00 \mathrm{~g}, 8.2 \mathrm{mmol}$ ) and potassium carbonate $(4.53 \mathrm{~g}, 32.7 \mathrm{mmol})$ in dimethyl formamide $\left(40 \mathrm{~cm}^{3}\right)$ was added benzyl bromide $\left(1.2 \mathrm{~cm}^{3}\right.$, 10.1 mmol ). The mixture was then put under argon and heated to $90^{\circ} \mathrm{C}$ for 2 hours. The dimethyl formamide was then evaporated in vacuo. The crude product was then dissolved in chloroform ( $120 \mathrm{~cm}^{3}$ ) and filtered through celite, and washed with water ( $3 \times 40 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1) afforded 221 as a pale yellow solid ( $1.67 \mathrm{~g}, 7.9 \mathrm{mmol}, 96 \%$ ); m.p. $73-74{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.76\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2829,2745,1685,1598,1574,1509,1462,1452,1425,1259$, $1163,1018,829 ; \delta{ }^{1} \mathrm{H}^{2} \mathrm{NMR}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 5.15\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-1^{\prime}\right)$ ), $7.08(2 \mathrm{H}, \mathrm{d}, J 8.8$ Hz, H-3' \& H-5'), 7.33 - 7.47 (5H, m, H-2'’' - H-6'’'), 7.84 (2H, d, J 8.8 Hz, H-2' \& H-6'), $9.89(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1) ; \delta^{13} \mathrm{C}\left(100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 70.28\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right), 115.16(\mathrm{~s}, \mathrm{CH}), 127.54(\mathrm{~s}$, CH ), 128.39 ( $\mathrm{s}, \mathrm{CH}$ ), 128.78 ( $\mathrm{s}, \mathrm{CH}$ ), 130.09 ( $\mathrm{s}, \mathrm{C}$ ), 132.07 ( $\mathrm{s}, \mathrm{CH}$ ), 135.94 (s, C), 163.76 (s, C), 190.92 (s, CHO).

## Chapter 6 - Experimental

3-(4-Chlorophenyl)-2,3-dihydro-4,5,6-trimethoxyinden-1-one 222

The indanone 222 was obtained following Protocol C. Using (E)-3-(4-chlorophenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one 206 ( $0.24 \mathrm{~g}, 0.72 \mathrm{mmol}$ ) in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate $\left(2 \times 5 \mathrm{~cm}^{3}\right)$ washed with saturated aqueous sodium bicarbonate solution $\left(5 \mathrm{~cm}^{3}\right)$. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3) afforded 222 as yellow solid ( $0.13 \mathrm{~g}, 0.39 \mathrm{mmol}, 53 \%$ ); m.p. 74-75 ${ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.50\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2960,2840,1703,1598,1491,1469$, $1431,1417,1341,1306,1127,1090,1014,793 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 2.49 ( $1 \mathrm{H}, \mathrm{dd}, J 2.8,19.3 \mathrm{~Hz}, \mathrm{H}-2$ ), 3.12 ( $1 \mathrm{H}, \mathrm{dd}, J 8.0,19.3 \mathrm{~Hz}, \mathrm{H}-2$ ) $3.33\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.83$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.48(1 \mathrm{H}, \mathrm{dd}, J 2.8,8.0 \mathrm{~Hz}, \mathrm{H}-3), 6.98(2 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}$, H-3' \& H-5'), 7.01 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7$ ), 7.19 ( $2 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-2^{\prime} \& \mathrm{H}-6$ '); $\delta^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 40.97(\mathrm{~s}, \mathrm{CH}), 47.01\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.28\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.11\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.93(\mathrm{~s}$, $\mathrm{OCH}_{3}$ ), 100.29 (s, CH), 128.63 (s, CH), 128.76 (s, CH), 132.17 (s, C), 132.33 (s, C), 142.93 (s, C), 144.02 (s, C), 148.73 ( $\mathrm{s}, \mathrm{C}$ ), 150.27 ( $\mathrm{s}, \mathrm{C}$ ), 155.10 ( $\mathrm{s}, \mathrm{C}$ ), 204.93 ( $\mathrm{s}, \mathrm{C}=\mathrm{O}$ ); m/z ( $\mathrm{AP}+$ ) $333\left(\mathrm{MH}^{+}, 100 \%\right), 335\left(\mathrm{MH}^{+}, 30 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 333.0890$ for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Cl}$, $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Cl}$ requires $[\mathrm{MH}]^{+} 333.088$.

3-(3-Bromo-4-methoxyphenyl)-2,3-dihydro-4,5,6-trimethoxyinden-1-one 223

The indanone 223 was obtained following Protocol C. Using (E)-3-(3-bromo-4-methoxyphenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one 207 ( $0.26 \mathrm{~g}, 0.64 \mathrm{mmol}$ ) in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5 \mathrm{~cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution $\left(5 \mathrm{~cm}^{3}\right)$. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane $1: 3$ ) afforded 223 as brown solid ( 0.15 g, $0.37 \mathrm{mmol}, 59 \%$ ); m.p. $128-129{ }^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.39\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right)$; $v_{\text {max }}\left(\mathrm{cm}^{-1}\right)$ $2956,2834,1699,1601,1497,1462,1442,1419,1342,1281,1092,1021,814 ; \delta^{1}{ }^{H}$ NMR

## Chapter 6 - Experimental

( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.51(1 \mathrm{H}, \mathrm{dd}, J 2.6,19.3 \mathrm{~Hz}, \mathrm{H}-2), 3.10(1 \mathrm{H}, \mathrm{dd}, J 8.0,19.3 \mathrm{~Hz}, \mathrm{H}-$ 2) $3.36\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.84\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.44$ ( $1 \mathrm{H}, \mathrm{dd}, J 2.6,8.0 \mathrm{~Hz}, \mathrm{H}-3$ ), 6.74 ( $1 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-5^{\prime}$ ), 6.94 ( $1 \mathrm{H}, \mathrm{dd}, J 2.3,8.5 \mathrm{~Hz}, \mathrm{H}-6^{\prime}$ ), $7.01(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7), 7.22\left(1 \mathrm{H}, \mathrm{d}, J 2.3 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 40.46(\mathrm{~s}$, $\mathrm{CH}), 47.06\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.26\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.28\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.20\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.94\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 100.31 (s, CH), 111.61 ( $\mathrm{s}, \mathrm{CBr}), 111.88(\mathrm{~s}, \mathrm{CH}), 127.17$ (s, CH), 132.06 (s, CH), 132.12 (s, C), 137.93 (s, C), 144.76 ( $\mathrm{s}, \mathrm{C}), 148.76$ (s, C), 150.29 (s, C), 154.53 (s, C), 155.06 (s, C), $205.01(\mathrm{~s}, \mathrm{C}=\mathrm{O}) ; m / z(\mathrm{AP}+) 407\left(\mathrm{MH}^{+}, 100 \%\right), 409\left(\mathrm{MH}^{+}, 70 \%\right) ;$ HRMS found $[\mathrm{MH}]^{+}$ 407.0495 for $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{5} \mathrm{Br}, \mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{5} \mathrm{Br}$ requires $[\mathrm{MH}]^{+} 407.0489$.

3-(3,4-Dichlorophenyl)-2,3-dihydro-4,5,6-trimethoxyinden-1-one 224

The indanone 224 was obtained following Protocol C. Using (E)-3-(3,4-dichlorophenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one $208(0.25 \mathrm{~g}, 0.68 \mathrm{mmol})$ in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate $(2 \times 5$ $\mathrm{cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution ( $5 \mathrm{~cm}^{3}$ ). Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:3) afforded 224 as light brown solid ( 0.17 g , $0.46 \mathrm{mmol}, 69 \%) ;$ m.p. $129-132^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.32\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ $2941,2898,2834,1710,1601,1557,1471,1431,1417,1346,1316,1121,1095,832 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.73(1 \mathrm{H}, \mathrm{dd}, J 2.8,19.3 \mathrm{~Hz}, \mathrm{H}-2), 3.11(1 \mathrm{H}, \mathrm{dd}, J 8.0,19.3$ $\mathrm{Hz}, \mathrm{H}-2), 3.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.84\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.46(1 \mathrm{H}, \mathrm{dd}, J 2.8$, $8.0 \mathrm{~Hz}, \mathrm{H}-3), 6.87\left(\mathrm{H}, \mathrm{dd}, J 2.3,8.3 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right), 7.02$ (H, s, H-7), 7.14 (H, d, J $2.3 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime}$ ), $7.29\left(\mathrm{H}, \mathrm{d}, J 8.3 \mathrm{~Hz}, \mathrm{H}-5\right.$ ) ; $\delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $40.72(\mathrm{~s}, \mathrm{CH}), 46.72(\mathrm{~s}$, $\mathrm{CH}_{2}$ ), $56.31\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.20\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.97\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 100.36(\mathrm{~s}, \mathrm{CH}), 126.62(\mathrm{~s}, \mathrm{CH})$, 129.27 ( $\mathrm{s}, \mathrm{CH}$ ), 130.58 ( $\mathrm{s}, \mathrm{CH}$ ), 132.17 ( $\mathrm{s}, \mathrm{C}), 132.57$ ( $\mathrm{s}, \mathrm{C}$ ), 143.11 ( $\mathrm{s}, \mathrm{C}), 144.68$ ( $\mathrm{s}, \mathrm{C})$, 148.65 ( $\mathrm{s}, \mathrm{C}$ ), 150.18 ( $\mathrm{s}, \mathrm{C}$ ), $155.31(\mathrm{~s}, \mathrm{C}), 204.34(\mathrm{~s}, \mathrm{C}=\mathrm{O}) ; m / z\left(\mathrm{AP}+\right.$ ) $367\left(\mathrm{MH}^{+}, 100 \%\right)$, $369\left(\mathrm{MH}^{+}, 60 \%\right)$; HRMS found [MH] 367.0501 for $\mathrm{C}_{18} \mathrm{H}_{17} \mathrm{O}_{4} \mathrm{Cl}_{2}, \mathrm{C}_{18} \mathrm{H}_{17} \mathrm{O}_{4} \mathrm{Cl}_{2}$ requires [MH] 367.0498 .

## Chapter 6 - Experimental

3-(Benzo[d][1,3]dioxol-5-yl)-2,3-dihydro-4,5,6-trimethoxyinden-1-one 225

The indanone 225 was obtained following Protocol C. Using ( $E$ )-3-(benzo[d][1,3]dioxol-5-yl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one $209(0.26 \mathrm{~g}, 0.76 \mathrm{mmol}$ ) in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5$ $\mathrm{cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution ( $5 \mathrm{~cm}^{3}$ ). Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane $1: 3$ ) afforded 225 as light brown solid ( 0.14 g , $.41 \mathrm{mmol}, 54 \%)$; m.p. $105-107{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.62\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\text {max. }} .\left(\mathrm{cm}^{-1}\right)$ 2973, 2938, 2837, 1706, 1593, 1506, 1487, 1478, 1468, 1456, 1444, 1431, 1417, 1340, 1308, $1246,1127,1036,1021,923,875,858 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.48(1 \mathrm{H}, \mathrm{dd}, J$ $2.5,19.1 \mathrm{~Hz}, \mathrm{H}-2), 3.09(1 \mathrm{H}, \mathrm{dd}, J 8.0,19.1 \mathrm{~Hz}, \mathrm{H}-2), 3.39\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.84(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.45(1 \mathrm{H}, \mathrm{dd}, J 2.5,8.0 \mathrm{~Hz}, \mathrm{H}-3), 5.85(2 \mathrm{H}, \mathrm{dd}, J 1.5,4.1 \mathrm{~Hz}, \mathrm{H}-$ $\left.2^{\prime}\right), 6.45(1 \mathrm{H}, \mathrm{d}, J 1.8 \mathrm{~Hz}, \mathrm{H}-4$ '), $6.54(1 \mathrm{H}, \mathrm{dd}, J 1.8,8.0 \mathrm{~Hz}, \mathrm{H}-6$ '), $6.66(1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}, \mathrm{H}-$ $\left.7^{\prime}\right), 7.01(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7) ;{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 41.33(\mathrm{~s}, \mathrm{CH}), 47.30\left(\mathrm{~s}, \mathrm{CH}_{2}\right)$, $56.27\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.20\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.94\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 100.28(\mathrm{~s}, \mathrm{CH}), 101.00\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right)$, 107.49 (s, CH), 108.27 (s, CH), 120.36 (s, CH), 132.18 (s, C), 138.29 (s, C), 144.44 (s, C), 146.19 (s, C), 147.84 ( $\mathrm{s}, \mathrm{C}$ ), 148.80 ( $\mathrm{s}, \mathrm{C}$ ), 150.37 ( $\mathrm{s}, \mathrm{C}$ ), 154.94 (s, C), 205.28 (s, C=O); m/z (API-ES+) $343\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 343.11762$ for $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{6}, \mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{6}$ requires $[\mathrm{MH}]^{+} 343.11761$.

3-(4-Bromophenyl)-2,3-dihydro-4,5,6-trimethoxyinden-1-one 226

The indanone 226 was obtained following Protocol C. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5$ $\mathrm{cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution ( $5 \mathrm{~cm}^{3}$ ). Column

## Chapter 6 - Experimental

chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right)$ afforded 226 as a pale yellow oil $(0.07 \mathrm{~g}$, $0.19 \mathrm{mmol}, 33 \%) ; \mathrm{R}_{\mathrm{f}} 0.34\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max }} .\left(\mathrm{cm}^{-1}\right) 2938,2837,1702$, $1599,1468,1417,1340,1309,1125,1009,825 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 2.55 ( $1 \mathrm{H}, \mathrm{dd}, J 2.5,19.3 \mathrm{~Hz}, \mathrm{CH}_{2}$ ), $3.18\left(1 \mathrm{H}, \mathrm{dd}, J 7.8,19.3 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 3.41\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.92\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.54(1 \mathrm{H}, \mathrm{dd}, J 2.4,7.8 \mathrm{~Hz}, \mathrm{H}-3), 6.99(2 \mathrm{H}, \mathrm{d}, J 8.2 \mathrm{~Hz}$, H-2' \& H-6'), 7.08 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7$ ), 7.41 ( $2 \mathrm{H}, \mathrm{d}, J 8.2 \mathrm{~Hz}, \mathrm{H}-3^{\prime} \& \mathrm{H}-5^{\prime}$ ); $\delta^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 41.25(\mathrm{~s}, \mathrm{CH}), 47.16\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.48\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.32\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.12(\mathrm{~s}$, $\mathrm{OCH}_{3}$ ), 100.52 ( $\mathrm{s}, \mathrm{CH}$ ), 120.56 ( $\left.\mathrm{s}, \mathrm{C}\right), 129.21$ (s, CH), 131.91 (s, CH), 132.39 (s, C), 143.69 (s, C), 144.06 (s, C), 148.92 (s, C), 150.48 (s, C), 155.34 (s, C), 204.97 (s, CO); m/z(API ES+) $377\left(\mathrm{MH}^{+}, 100 \%\right), 379\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found [MH] 377.03851 for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Br}$, $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}_{4} \mathrm{Br}$ requires [ MH$]^{+} 377.03830$.

## 2,3-Dihydro-3-(4-carboxymethoxyphenyl)-4,5,6-trimethoxyinden-1-one 227

The indanone 227 was obtained following Protocol C. Using (E)-3-(4-carboxymethoxyphenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one 211 ( $0.24 \mathrm{~g}, 0.64 \mathrm{mmol}$ ) in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5 \mathrm{~cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution $\left(5 \mathrm{~cm}^{3}\right)$. Aqueous layer then washed acidified aqueous hydrochloric acid ( 1 M ) till the $\mathrm{pH} \sim 5-6$, then extracted with ethyl acetate $\left(2 \times 10 \mathrm{~cm}^{3}\right)$. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:methanol 49:1) afforded 227 as a cream solid ( $0.06 \mathrm{~g}, 0.16 \mathrm{mmol}, 26 \%$ ); m.p. 169 $171{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.63\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:methanol 49:1); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2930,2726,2668,1740$, $1667,1599,1512,1468,1439,1416,1344,1101,830 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 2.57 ( 1 H , dd, $J 2.7 \mathrm{~Hz}, J 19.2 \mathrm{~Hz}, \mathrm{H}-2$ ), $3.18(1 \mathrm{H}, \mathrm{dd}, J 8.1 \mathrm{~Hz}, J 19.2 \mathrm{~Hz}, \mathrm{H}-2), 3.36(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.55(1 \mathrm{H}, \mathrm{dd}, J 2.7 \mathrm{~Hz}, J 8.1 \mathrm{~Hz}, \mathrm{H}-3), 4.65$ ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{\prime}{ }^{\prime}$ ), $6.85\left(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right.$ \& H-5'), 7.05 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-2$ ' \& H-6'), 7.08 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7$ ); $\delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{D}_{6}$-DMSO; ppm) $47.62\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.81\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.51$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 61.22\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 65.18\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 100.94(\mathrm{~s}, \mathrm{CH}), 115.13(\mathrm{~s}, \mathrm{CH}), 128.72(\mathrm{~s}, \mathrm{CH})$, 132.41 (s, C), 137.52 (s, C), 144.56 (s, C), 148.73 (s, C), 150.61 ( s, C), 155.17 (s, C), 156.95 (s, C), $170.87\left(\mathrm{~s}, \mathrm{CO}_{2} \mathrm{H}\right), 204.81(\mathrm{~s}, \mathrm{CO}) ; m / z$ (API ES+) $373\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 373.12851$ for $\mathrm{C}_{20} \mathrm{H}_{21} \mathrm{O}_{7}, \mathrm{C}_{20} \mathrm{H}_{21} \mathrm{O}_{7} \mathrm{Br}$ requires [MH] 373.12818 .

## Chapter 6 - Experimental

2,3-Dihydro-4,5,6-trimethoxy-3-(2,3,4-trimethoxyphenyl)inden-1-one 228

The indanone 228 was obtained following Protocol C. Using (E)-3-(2,3,4-trimethoxyphenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one $212(0.23 \mathrm{~g}, 0.59 \mathrm{mmol})$ in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5$ $\mathrm{cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution ( $5 \mathrm{~cm}^{3}$ ). Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right)$ afforded 228 as a pale brown solid $(0.06 \mathrm{~g}$, $0.15 \mathrm{mmol}, 25 \%)$; m.p. $115-117^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.31\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\max .}\left(\mathrm{cm}^{-1}\right)$ 2932, 2838, 1699, 1597, 1497, 1469, 1434, 1418, 1337, 850; $\delta^{l}{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3}$; ppm) $2.59(1 \mathrm{H}$, broad d, $J 20.8 \mathrm{~Hz}, \mathrm{H}-2), 3.13(1 \mathrm{H}, \mathrm{dd}, J 8.2,19.0 \mathrm{~Hz}, \mathrm{H}-2), 3.39(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.71\left(3 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{OCH}_{3}\right), 3.82\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.92\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.78(1 \mathrm{H}, \mathrm{d}, J 5.6 \mathrm{~Hz}, \mathrm{H}-3), 6.56\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5{ }^{\prime}\right), 6.60(1 \mathrm{H}, \mathrm{br} . \mathrm{s}$, H-6'), $7.10(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7) ;{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 36.41$ (broad s, CH), 46.61 (s, $\mathrm{CH}_{2}$ ), $56.15\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.44\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.25\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.75$ (broad s, $\left.\mathrm{OCH}_{3}\right), 60.93$ (s, $\mathrm{OCH}_{3}$ ), $61.11\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 100.56(\mathrm{~s}, \mathrm{CH}), 107.37(\mathrm{~s}, \mathrm{CH}), 122.75$ (broad s, CH), 130.09 (broad s, C), 132.83 (s, C), 142.54 (s, C), 144.67 (s, C), 148.77 (s, C), 150.50 (s, C), 151.80 ( $\mathrm{s}, \mathrm{C}$ ), $152.76(\mathrm{~s}, \mathrm{C}), 154.81(\mathrm{~s}, \mathrm{C}), 205.99(\mathrm{~s}, \mathrm{CO}) ; m / z\left(\right.$ API ES + ) $389\left(\mathrm{MH}^{+}, 100 \%\right) ;$ HRMS found [MH] 389.16112 for $\mathrm{C}_{21} \mathrm{H}_{25} \mathrm{O}_{7}, \mathrm{C}_{21} \mathrm{H}_{25} \mathrm{O}_{7}$ requires [MH] ${ }^{+} 389.15948$.

## 3-(2,6-Dichlorophenyl)-2,3-dihydro-4,5,6-trimethoxyinden-1-one 229

The indanone 229 was obtained following Protocol C. Using (E)-3-(2,6-dichlorophenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one $213(0.24 \mathrm{~g}, 0.65 \mathrm{mmol})$ in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5$ $\mathrm{cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution ( $5 \mathrm{~cm}^{3}$ ). Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3) afforded 229 as a pink solid ( $0.23 \mathrm{~g}, 0.63$ mmol, $95 \%$ ); m.p. $98-102{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.46\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\max .}\left(\mathrm{cm}^{-1}\right) 2999$,

3-(3,4-Dichlorophenyl)-2,3-dihydro-5,6-dimethoxyinden-1-one $\mathbf{2 5 0}^{215}$

The indanone 250 was obtained following Protocol C. Using ( $E$ )-3-(3,4,5-trimethoxyphenyl)-1-(3,4-dimethoxyphenyl)prop-2-en-1-one $240(0.24 \mathrm{~g}, \quad 0.70 \mathrm{mmol})$ in anhydrous trifluoroacetic acid $\left(0.3 \mathrm{~cm}^{3}\right)$. Tipped into water $\left(5 \mathrm{~cm}^{3}\right)$, extracted with ethyl acetate ( $2 \times 5$ $\mathrm{cm}^{3}$ ) washed with saturated aqueous sodium bicarbonate solution ( $5 \mathrm{~cm}^{3}$ ). Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3) afforded 250 as a light brown solid $(0.031 \mathrm{~g}$, $0.09 \mathrm{mmol}, 13 \%) ;$ m.p. $144-146{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.30\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ $2925,1694,1588,1498,1463,1417,1285,1254,1211,1112,1044,826 ; \delta{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 2.56(1 \mathrm{H}, \mathrm{dd}, J 3.5,19.1 \mathrm{~Hz}, \mathrm{H}-2), 3.21(1 \mathrm{H}, \mathrm{dd}, J 7.6,19.1 \mathrm{~Hz}, \mathrm{H}-2)$, $3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.44(1 \mathrm{H}, \mathrm{dd}, J 3.5,7.6 \mathrm{~Hz}, \mathrm{H}-3), 6.60(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6)$, 6.84 ( $\left.1 \mathrm{H}, \mathrm{dd}, J 2.1,8.4 \mathrm{~Hz}, \mathrm{H}^{\prime} 6^{\prime}\right), 7.22$ ( $1 \mathrm{H}, \mathrm{d}, J 2.1 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ), 7.23 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7$ ), 7.85 ( 1 H , d, $\left.J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 43.57(\mathrm{~s}, \mathrm{CH}), 47.10\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.43$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 56.59\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 104.07(\mathrm{~s}, \mathrm{CH}), 107.42(\mathrm{~s}, \mathrm{CH}), 127.14(\mathrm{~s}, \mathrm{CH}), 129.85(\mathrm{~s}, \mathrm{CH})$, 130.13 (s, C), 131.16 (s, CH), 131.30 (s, C), 133.16 (s, C), 144.44 (s, C), 150.40 (s, C), 151.93 (s, C), 156.21 (s, C), 203.74 (s, CO); m/z(API ES+) $337\left(\mathrm{MH}^{+}, 100 \%\right), 339\left(\mathrm{MH}^{+}\right.$, $60 \%$ ).

252

The method adopted was that of Beugelmans ${ }^{226}$ et al. To a stirring solution of 3,4,5trimethoxybenzaldehyde $(3.96 \mathrm{~g}, 20.2 \mathrm{mmol})$ in chloroform $\left(40 \mathrm{~cm}^{3}\right)$ was added $N$ bromosuccinimide $(3.84 \mathrm{~g}, 21.6 \mathrm{mmol})$. The reaction was then put under argon and refluxed at $75{ }^{\circ} \mathrm{C}$ for 4 hours. The reaction was then left stirring overnight at room temperature. The solvent was then evaporated in vacuo, and column chromatography $\left(\mathrm{SiO}_{2}\right.$, dichloromethane) afforded 252 as a white solid ( $4.60 \mathrm{~g}, 16.7 \mathrm{mmol}, 83 \%$ ); m.p. $69-70{ }^{\circ} \mathrm{C}$; $\mathrm{R}_{\mathrm{f}} 0.40\left(\mathrm{SiO}_{2}, \mathrm{DCM}\right) ; v_{\max .}\left(\mathrm{cm}^{-1}\right) 2943,2866,1684,1578,1564,1471,1449,1426,1404$, $1383,1326,1197,1165,1002,981,920,859,726 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 3.91 $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.98\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.31(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6$ '), $10.30(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-$ 1); $\delta{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.27\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.24\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.31\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 107.44 (s, CH), 115.69 (s, C), 128.80 (s, C), 148.72 (s, C), 150.79 (s, C), 153.03 (s, C), 191.15 (s, CHO).

## 1-(2-Bromo-3,4,5-trimethoxyphenyl)ethanol $\mathbf{2 5 3}^{346}$

253
To a stirring solution of methylmagnesium chloride in tetrahydrofuran $\left(8.8 \mathrm{~cm}^{3}, 26.4 \mathrm{mmol}\right.$, $3 \mathrm{M})$ in anhydrous tetrahydrofuran $\left(30 \mathrm{~cm}^{3}\right)$ under argon at $0^{\circ} \mathrm{C}$, was slowly added 2-bromo-3,4,5-trimethoxybenzaldehyde $252(4.53 \mathrm{~g}, 16.5 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( 20 $\mathrm{cm}^{3}$ ). The reaction was then stirred overnight at room temperature and then poured into mixture of concentrated aqueous ammonium chloride solution ( $100 \mathrm{~cm}^{3}$ ) and ice, and then extracted with ethyl acetate $\left(6 \times 20 \mathrm{~cm}^{3}\right)$. The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo to afforded 253 as a yellow oil $(4.74 \mathrm{~g}, 16.3 \mathrm{mmol}, 99 \%) ; \mathrm{R}_{\mathrm{f}} 0.33\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\max }\left(\mathrm{cm}^{-1}\right) 3476$, $2972,2939,1664,1570,1478,1450,1426,1391,1316,1196,1160,1045,999,857,796 ; \delta$ ${ }^{\mathrm{I}} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $1.44(3 \mathrm{H}, \mathrm{d}, J 6.4 \mathrm{~Hz}, \mathrm{H}-2), 2.16(1 \mathrm{H}, \mathrm{d}, J 1.2 \mathrm{~Hz}, \mathrm{OH}-1)$, $3.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.22(1 \mathrm{H}, \mathrm{dq}, J 1.2 \mathrm{~Hz}, 6.4 \mathrm{~Hz}$,

(E)-1-(2-Bromo-3,4,5-trimethoxyphenyl)-3-(3-hydroxy-4-methoxyphenyl)prop-2-en-1-one

255

To a stirring mixture of Using 1-(2-bromo-3,4,5-trimethoxyphenyl)ethanone 251 ( $2.23 \mathrm{~g}, 7.7$ $\mathrm{mmol})$ and 3-hydroxy-4-methoxybenzaldehyde $(1.18 \mathrm{~g}, 7.7 \mathrm{mmol})$ in methanol $\left(13 \mathrm{~cm}^{3}\right)$ was added an aqueous sodium hydroxide solution $\left(3.1 \mathrm{~cm}^{3}, 10 \mathrm{M}\right)$. The mixture was then stirred overnight at room temperature forming a red solution; the mixture was then acidified with aqueous hydrochloric acid ( 1 M ) till the $\mathrm{pH} \sim 5-6$, solution turns yellow. The mixture was then extracted with dichloromethane $\left(3 \times 30 \mathrm{~cm}^{3}\right)$, the organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Recrystallization from methanol afforded 255 as cream crystals ( $2.51 \mathrm{~g}, 5.9 \mathrm{mmol}, 77 \%$ ); m.p. $157-159{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}$ $0.18\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }} .\left(\mathrm{cm}^{-1}\right) 3459,3004,2945,2846,1640,1605,1564$, $1508,1482,1459,1441,1385,1343,1259,1217,1158,1012,1002,906,810,760 ; \delta{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.67(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-3 ')$ ), $6.78\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6\right.$ '), $6.86\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right)$ ), $6.96(1 \mathrm{H}, \mathrm{d}, J 16.0 \mathrm{~Hz}, \mathrm{H}-2), 7.08\left(1 \mathrm{H}, \mathrm{dd}, J 2.0,8.4 \mathrm{~Hz}, \mathrm{H}-\mathbf{6}^{\prime}\right), 7.20\left(1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-2{ }^{\prime}{ }^{\prime}\right)$, $7.40(1 \mathrm{H}, \mathrm{d}, J 16.0 \mathrm{~Hz}, \mathrm{H}-3) ; \delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.07\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.29(\mathrm{~s}$, $\left.\mathrm{OCH}_{3}\right), 61.19\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.24\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.52(\mathrm{~s}, \mathrm{CBr}), 108.00(\mathrm{~s}, \mathrm{CH}), 110.57(\mathrm{~s}, \mathrm{CH})$, 113.31 ( $\mathrm{s}, \mathrm{CH}$ ), 122.85 ( $\mathrm{s}, \mathrm{CH}$ ), 124.33 ( $\mathrm{s}, \mathrm{CH}$ ), 128.09 ( $\mathrm{s}, \mathrm{C}), 137.04$ ( $\mathrm{s}, \mathrm{C}), 144.58$ (s, C), 145.95 (s, C), 146.13 (s, CH), 149.10 (s, C), 151.09 (s, C), 152.98 (s, C), 194.04 (s, CO); $m / z(\mathrm{AP}+) 423\left(\mathrm{MH}^{+}, 100 \%\right), 425\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 423.04471$ for $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{6} \mathrm{Br}, \mathrm{C}_{19} \mathrm{H}_{20} \mathrm{O}_{6} \mathrm{Br}$ requires $[\mathrm{MH}]^{+} 423.04378$; CHN found $\mathrm{C} 53.56 \%, \mathrm{H} 4.49 \% \mathrm{CHN}$ requires C $53.92 \%$, H $4.52 \%$.

## Chapter 6 - Experimental

Protocol D
The method adopted was that of Clark ${ }^{225}$ et al. To a mixture of the $2^{\prime}$-bromochalcone ( 1 mmol ) and potassium carbonate ( $0.350 \mathrm{~g}, 2.53 \mathrm{mmol}$ ) in anhydrous dimethyl formamide ( 8 $\mathrm{cm}^{3}$ ) in a Schlenk tube was added palladium(II) chloride ( $0.005 \mathrm{~g}, 0.028 \mathrm{mmol}$ ) and triphenylphosphine $(0.019 \mathrm{~g}, 0.071 \mathrm{mmol})$. The Schlenk tube was then degassed by evacuation, and put under argon. The reaction was then heated to $110^{\circ} \mathrm{C}$ for 30 minutes. The reaction was then cooled to room temperature and had water $\left(5 \mathrm{~cm}^{3}\right)$ added to it, and stirred overnight. The precipitate was then filtered off, washed with water $\left(2 \mathrm{~cm}^{3}\right)$. The wet solid was then dissolved in ethyl acetate $\left(3 \mathrm{~cm}^{3}\right)$, and was heated to $65^{\circ} \mathrm{C}$ with an aqueous potassium thiocyanate solution $\left(1.5 \mathrm{~cm}^{3}, 2 \mathrm{M}\right)$ under argon for 1 hour. The mixture was then cooled to room temperature and extracted with ethyl acetate ( $2 \times 3 \mathrm{~cm}^{3}$ ), the combined organic fractions were then washed with water $\left(2 \times 3 \mathrm{~cm}^{3}\right)$ and brine $\left(3 \mathrm{~cm}^{3}\right)$ then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo.

## 4,5,6-Trimethoxy-3-(4-methoxyphenyl)-1H-inden-1-one 256

The indenone 256 was obtained following Protocol D. Using ( $E$ )-1-(2-bromo-3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one $254 \quad(0.407 \quad \mathrm{~g}, 1.00 \mathrm{mmol})$. Recrystallization from ethyl acetate and hexane afforded 256 as bright red crystals ( 0.287 g , $0.88 \mathrm{mmol}, 88 \%) ;$ m.p. $107-109{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.63\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\max } .\left(\mathrm{cm}^{-1}\right)$ $2940,1696,1600,1505,1463,1404,1360,1247,1103,1025,970,830 ; \delta{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.48\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.79\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91(3 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), $5.73(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 6.95(2 \mathrm{H}, \mathrm{d}, J 8.9 \mathrm{~Hz}, \mathrm{H}-3$ ' \& H-5'), $7.01(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7), 7.66(2 \mathrm{H}, \mathrm{d}$, $\left.J 8.9 \mathrm{~Hz}, \mathrm{H}-2{ }^{\prime} \& \mathrm{H}-6^{\prime}\right) ; \delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 55.38\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.47(\mathrm{~s}$, $\left.\mathrm{OCH}_{3}\right), 61.22\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.64\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 104.45(\mathrm{~s}, \mathrm{CH}), 113.269(\mathrm{~s}, \mathrm{CH}), 122.29(\mathrm{~s}, \mathrm{CH})$, 126.49 ( $\mathrm{s}, \mathrm{CH}$ ), 127.21 ( $\mathrm{s}, \mathrm{C}$ ), 129.02 ( $\mathrm{s}, \mathrm{C}$ ), 129.63 ( $\mathrm{s}, \mathrm{CH}$ ), 146.83 ( $\mathrm{s}, \mathrm{C}), 149.17$ ( $\mathrm{s}, \mathrm{C}$ ), 154.54 (s, C), 161.18 (s, C), 164.55 (s, C), 195.93 (s, CO); m/z(AP+) $327\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found [MH] ${ }^{+} 327.12425$ for $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{5}, \mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{5}$ requires [ MH$]^{+}$327.12270.

Chapter 6 - Experimental
(E)-1-(2-Bromo-3,4,5-trimethoxyphenyl)-3-(3-tert-butyldimethylsilaneoxy-4-methoxy phenyl)prop-2-en-1-one 257

A mixture of ( $E$ )-1-(2-bromo-3,4,5-trimethoxyphenyl)-3-(3-hydroxy-4-methoxyphenyl)prop-2-en-1-one $255(1.99 \mathrm{~g}, 4.7 \mathrm{mmol})$, imidazole $(0.39 \mathrm{~g}, 5.7 \mathrm{mmol})$ and tertbutylchlorodimethylsilane ( $0.85 \mathrm{~g}, 5.6 \mathrm{mmol}$ ) in anhydrous dimethyl formamide $\left(10 \mathrm{~cm}^{3}\right)$ under argon was stirred at room temperature for 3 days. The mixture was then diluted with dichloromethane ( $15 \mathrm{~cm}^{3}$ ) and washed with water ( $2 \times 15 \mathrm{~cm}^{3}$ ), the organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3) afforded 257 a yellow oil which solidified as a cream solid ( $2.24 \mathrm{~g}, 4.2 \mathrm{mmol}, 89 \%$ ); m.p. $53-55{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.58\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }} .\left(\mathrm{cm}^{-1}\right) 2937,2854,1640,1618,1510,1481,1439,1427,1382$, 1337, 1263, 1106, 1012, 997, 985, 861, 838; $\delta{ }^{1}{ }^{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $0.16(6 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.00\left(9 \mathrm{H}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right), 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.95\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.77\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6^{\prime}\right), 6.85\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 6.93(1 \mathrm{H}, \mathrm{d}, J$ $16.1 \mathrm{~Hz}, \mathrm{H}-2), 7.10$ (1H, d, J 2.1 Hz, H-2'’), 7.14 (1H, dd, J 2.1, $\left.8.4 \mathrm{~Hz}, \mathrm{H}-\mathbf{6}^{\prime \prime}\right), 7.37$ ( $1 \mathrm{H}, \mathrm{d}$, $J 16.1 \mathrm{~Hz}, \mathrm{H}-3$ ); $\delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) -4.59 (s, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 18.47$ (s, $\left.\mathrm{Si} \underline{( }\left(\mathrm{CH}_{3}\right)_{3}\right), 25.70\left(\mathrm{~s}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right), 55.48\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.30\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.18\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.23$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 106.49(\mathrm{~s}, \mathrm{CBr}), 107.97(\mathrm{~s}, \mathrm{CH}), 111.71(\mathrm{~s}, \mathrm{CH}), 120.10(\mathrm{~s}, \mathrm{CH}), 123.95(\mathrm{~s}, \mathrm{CH})$, 124.11 (s, CH), 127.47 (s, C), 137.06 (s, C), 144.51 (s, C), 145.36 (s, C), 146.42 (s, CH), 151.08 (s, C), 152.97 (s, C), $153.80(\mathrm{~s}, \mathrm{C}), 194.20(\mathrm{~s}, \mathrm{CO}) ; m / z(\mathrm{AP}+) 537\left(\mathrm{MH}^{+}, 90 \%\right), 539$ $\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 537.13138$ for $\mathrm{C}_{25} \mathrm{H}_{33} \mathrm{BrO}_{6} \mathrm{Si}, \mathrm{C}_{25} \mathrm{H}_{33} \mathrm{BrO}_{6} \mathrm{Si}$ requires $[\mathrm{MH}]^{+} 537.13025$; CHN found C $55.78 \%$, H 6.16\%, CHN requires C $55.86 \%$, H 6.19\%.
(E)-3-(3-(Benzyloxy)-4-methoxyphenyl)-1-(2-bromo-3,4,5-trimethoxyphenyl)prop-2-en-1-one 258

## Chapter 6 - Experimental

The chalcone 258 was obtained following Protocol A. Using 1-(2-bromo-3,4,5trimethoxyphenyl)ethanone $251(1.24 \mathrm{~g}, 4.3 \mathrm{mmol}$ ), 3-(benzyloxy)-4-methoxybenzaldehyde $262(1.06 \mathrm{~g}, 4.4 \mathrm{mmol})$ and aqueous sodium hydroxide solution $\left(0.9 \mathrm{~cm}^{3}, 10 \mathrm{M}\right)$ in methanol $\left(3.0 \mathrm{~cm}^{3}\right)$. Recrystallization from methanol afforded 258 as cream crystals $(1.85 \mathrm{~g}, 3.6 \mathrm{mmol}$, $84 \%$ ); m.p. 111-112 ${ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.68\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2935,1629$, $1615,1593,1510,1480,1444,1426,1386,1342,1256,1230,1157,1132,1101,1008,979$, 805, 702; $\delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.95\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.18\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-1{ }^{\prime}{ }^{\prime \prime}\right), 6.77(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6$ '), $6.90(1 \mathrm{H}, \mathrm{d}, J$ $15.6 \mathrm{~Hz}, \mathrm{H}-2), 6.90\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right)$ ), 7.13 ( $\left.1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-2^{\prime}{ }^{\prime}\right), 7.16$ ( $1 \mathrm{H}, \mathrm{dd}, J$

## Chapter 6 - Experimental

3-(Benzyloxy)-4-methoxybenzaldehyde $\mathbf{2 6 2}^{347}$

262
Benzyl bromide ( $2.3 \mathrm{~cm}^{3}, 19.4 \mathrm{mmol}$ ) was added to a mixture of 3-hydroxy-4methoxybenzaldehyde ( $2.86 \mathrm{~g}, 18.8 \mathrm{mmol}$ ) and potassium carbonate $(10.5 \mathrm{~g}, 76.0 \mathrm{mmol})$ in anhydrous dimethyl formamide $\left(100 \mathrm{~cm}^{3}\right)$. The mixture was then put under argon and heated to $90^{\circ} \mathrm{C}$ for 2 hours. The dimethyl formamide was then evaporated in vacuo. The crude product was then dissolved in chloroform ( $300 \mathrm{~cm}^{3}$ ) and filtered through celite, and washed with water ( $6 \times 50 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo, to afforded 262 as a pale yellow solid ( $4.49 \mathrm{~g}, 18.5$ $\mathrm{mmol}, 99 \%$ ); m.p. $53-55{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.63\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\max }\left(\mathrm{cm}^{-1}\right) 2966$, 2934, 2812, 2749, 2718, 1677, 1596, 1582, 1505, 1456, 1431, 1383, 1235, 1128, 1008, 805, 734,$697 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.11\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-1{ }^{\prime}{ }^{\prime}\right), 6.91$ ( $1 \mathrm{H}, \mathrm{d}, J 8.3 \mathrm{~Hz}, \mathrm{H}-5^{\prime}$ ), $7.21-7.42$ ( $7 \mathrm{H}, \mathrm{m}, \mathrm{H}-2^{\prime}, \mathrm{H}-6$ ', H-2'"' $-\mathrm{H}-6^{\prime}{ }^{\prime}$ ), 9.74 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1$ ); $\delta$ ${ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.22\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 70.82\left(\mathrm{~s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 110.75$ (s, CH), 111.23 (s, CH), 126.98 ( $\mathrm{s}, \mathrm{CH}$ ), 127.51 ( $\mathrm{s}, \mathrm{CH}$ ), 128.16 ( $\mathrm{s}, \mathrm{CH}), 128.68$ ( $\mathrm{s}, \mathrm{CH}), 129.96$ (s, C), 136.27 (s, C), 148.68 (s, C), 155.03 (s, C), 190.92 (s, CHO).

## 3-Isopropoxy-4-methoxybenzaldehyde $\mathbf{2 6 3}^{227}$

263
The method adopted was that of Ridley ${ }^{227}$ et al. A mixture 3-hydroxy-4-methoxy benzaldehyde ( $1.54 \mathrm{~g}, 10.1 \mathrm{mmol}$ ), isopropyl bromide $\left(1.45 \mathrm{~cm}^{3}, 15.4 \mathrm{mmol}\right)$ and potassium carbonate ( $2.27 \mathrm{~g}, 16.5 \mathrm{mmol}$ ) in anhydrous dimethyl formamide $\left(8 \mathrm{~cm}^{3}\right)$ was stirred at room temperature for 96 hours. The mixture was then poured in water ( $24 \mathrm{~cm}^{3}$ ) and extracted with diethyl ether $\left(3 \times 20 \mathrm{~cm}^{3}\right)$. The organic fraction was then washed with aqueous sodium hydroxide solution ( $3 \times 30 \mathrm{~cm}^{3}, 1 \mathrm{M}$ ), dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:9) afforded 263 as a yellow brown oil ( $1.73 \mathrm{~g}, 8.9 \mathrm{mmol}, 88 \%) ; \mathrm{R}_{\mathrm{f}} 0.23\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:9); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2977,2935,2841,1685,1582,1506,1464,1432,1238,1128,1109 ; \delta^{1} \mathrm{H}$ NMR

## Chapter 6 - Experimental

( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $1.40\left(6 \mathrm{H}, \mathrm{d}, J 6.1 \mathrm{~Hz}, \mathrm{H}-2\right.$ ' \& H-3'’), $3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.65$ ( $1 \mathrm{H}, \mathrm{sp}, J 6.1 \mathrm{~Hz}, \mathrm{H}-1$ ''), 6.98 ( $1 \mathrm{H}, \mathrm{d}, J 8.2 \mathrm{~Hz}, \mathrm{H}-5^{\prime}$ ), $7.41\left(1 \mathrm{H}, \mathrm{d}, J 1.8 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right), 7.44$ ( 1 H , dd, $J 1.8,8.2 \mathrm{~Hz}, \mathrm{H}-6$ '), $\left.9.84(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1) ; \delta{ }^{13} \mathrm{C} \mathrm{NMR} \mathrm{( } 100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 21.91$ (s, $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 56.18\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 71.26\left(\mathrm{~s}, \underline{\mathrm{CH}}\left(\mathrm{CH}_{3}\right)_{2}\right), 110.87(\mathrm{~s}, \mathrm{CH}), 112.46(\mathrm{~s}, \mathrm{CH}), 126.55(\mathrm{~s}$, CH ), $130.01(\mathrm{~s}, \mathrm{C}), 147.84(\mathrm{~s}, \mathrm{C}), 155.60(\mathrm{~s}, \mathrm{C}), 191.04(\mathrm{~s}, \mathrm{CHO}) ; m / z(\mathrm{AP}+) 125\left(\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{O}_{2}\right.$, $50 \%), 153\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{O}_{2}, 35 \%\right), 195\left(\mathrm{MH}^{+}, 100 \%\right)$.

4-Methoxy-3-(methoxymethoxy)benzaldehyde 264 ${ }^{348}$

264

The method was adapted from that of Crombie ${ }^{228}$ et al. To a stirring solution of sodium hydride ( $0.32 \mathrm{~g}, 8.0 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) in anhydrous dimethyl formamide $\left(4 \mathrm{~cm}^{3}\right)$ at $0{ }^{\circ} \mathrm{C}$ under argon 3-hydroxy-4-methoxybenzaldeyde ( $1.00 \mathrm{~g}, 6.6 \mathrm{mmol}$ ) in anhydrous dimethyl formamide ( $4 \mathrm{~cm}^{3}$ ) was added slowly drop wise over 20 minutes. The reaction was then allowed to warm to room temperature and was stirred at room temperature for 30 minutes, before being cooled to $0^{\circ} \mathrm{C}$. Chloromethyl methyl ether $\left(0.60 \mathrm{~cm}^{3}, 7.9\right.$ mmol ) in anhydrous dimethyl formamide ( $2 \mathrm{~cm}^{3}$ ) was then added drop wise over 30 minutes to the mixture at $0^{\circ} \mathrm{C}$. The mixture was then stirred for 30 minutes at $0^{\circ} \mathrm{C}$ and then stirred overnight at room temperature. The reaction was then tipped into a mixture of water $\left(10 \mathrm{~cm}^{3}\right)$ and ice $(10 \mathrm{~g})$, and extracted with dichloromethane $\left(4 \times 15 \mathrm{~cm}^{3}\right)$. The organic fraction was washed with an aqueous sodium hydroxide solution $\left(2 \times 15 \mathrm{~cm}^{3}, 1.0 \mathrm{M}\right)$ and water $(2 \times 15$ $\mathrm{cm}^{3}$ ), it was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Purification by column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane $1: 3$ ) afforded 264 as a cream solid ( $1.14 \mathrm{~g}, 5.8 \mathrm{mmol}, 88 \%$ ); m.p. $29-31{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.69\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 1) ; v_{\max }\left(\mathrm{cm}^{-1}\right) 2952,2839,2767,1678,1595,1584,1507,1464,1434,1231,1151,1125$, 1073, 997, 916, 803, 730; $\delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.53\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.97$ (3H, s, OCH ${ }_{3}$ ), $5.29\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{\prime}\right), 7.01\left(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 7.55(1 \mathrm{H}, \mathrm{dd}, J 1.9, J 8.4 \mathrm{~Hz}$, H-6'), $7.67\left(1 \mathrm{H}, \mathrm{d}, J 1.9 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right), 9.86(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1) ; \delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $56.20\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.42\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 95.41\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right), 111.13(\mathrm{~s}, \mathrm{CH}), 115.39(\mathrm{~s}, \mathrm{CH}), 126.78$ (s, CH), 130.17 (s, C), 146.97 (s, C), 155.08 (s, C), 190.77 (s, CHO); m/z(API ES+) 197 $\left(\mathrm{MH}^{+}, 100 \%\right)$.

## Chapter 6 - Experimental

3-(3-Tert-butyldimethylsilaneoxy-4-methoxyphenyl)-4,5,6-trimethoxy-1H-inden-1-one 261

261

A mixture of (E)-1-(2-bromo-3,4,5-trimethoxyphenyl)-3-(3-tert-butyldimethylsilaneoxy-4-methoxyphenyl)prop-2-en-1-one $257(0.104 \mathrm{~g}, 0.19 \mathrm{mmol})$, potassium carbonate ( 0.075 g , $0.54 \mathrm{mmol})$, palladium(II) chloride $(0.001 \mathrm{~g}, 0.0056 \mathrm{mmol})$ and triphenylphosphine ( 0.005 g , 0.019 mmol ) was dissolved in anhydrous dimethyl formamide ( $1.5 \mathrm{~cm}^{3}$ ) and sealed in a pressure-rated reaction vial $\left(10 \mathrm{~cm}^{3}\right)$. The reaction vial was then irradiated in a self-turning single-mode CEM Discovery ${ }^{\text {TM }}$ Focused Synthesizer. The reaction was maintained at $160^{\circ} \mathrm{C}$ (power: 150 W ) for 15 minutes. The mixture was then rapidly cooled to room temperature, then had water ( $1.5 \mathrm{~cm}^{3}$ ) added to it and left at room temperature overnight. The precipitate was then filtered off, washed with water $\left(1 \mathrm{~cm}^{3}\right)$. The wet solid was then dissolved in ethyl acetate $\left(3 \mathrm{~cm}^{3}\right)$, and was heated to $65^{\circ} \mathrm{C}$ with an aqueous potassium thiocyanate solution (1 $\mathrm{cm}^{3}, 2 \mathrm{M}$ ) under argon for 1 hour. The mixture was then cooled to room temperature and extracted with ethyl acetate $\left(3 \mathrm{~cm}^{3}\right)$, the combined organic fractions were then washed with water ( $2 \times 1 \mathrm{~cm}^{3}$ ) and brine ( $2 \times 1 \mathrm{~cm}^{3}$ ) then dried over anhydrous sodium sulfate, filtered and evaporated in vacuo to afford 261 as a red gum ( $0.072 \mathrm{~g}, 0.16 \mathrm{mmol}, 81 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.63$ ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:3); $\quad v_{\max } .\left(\mathrm{cm}^{-1}\right) 2930,2855,1703,1597,1508,1465,1415$, 1338, 1262, 1106, 1026, 834; $\delta{ }^{\mathrm{l}} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $0.19\left(6 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right)$, $1.01\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 3.47\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90(3 \mathrm{H}$, $\mathrm{s}, \mathrm{OCH}_{3}$ ), $5.71(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 6.88(1 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-5$ '), $7.00(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7), 7.21(1 \mathrm{H}, \mathrm{d}, J 2.1$ $\left.\mathrm{Hz}, \mathrm{H}-2^{\prime}\right), 7.31\left(1 \mathrm{H}, \mathrm{dd}, J 2.1,8.7 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 0.00 (s, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right), 23.10\left(\mathrm{~s}, \underline{\mathrm{C}}\left(\mathrm{CH}_{3}\right)_{3}\right), 30.34\left(\mathrm{~s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 60.11\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.13\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 65.82$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 66.25\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 109.11(\mathrm{~s}, \mathrm{CH}), 115.65(\mathrm{~s}, \mathrm{CH}), 125.31(\mathrm{~s}, \mathrm{CH}), 126.64(\mathrm{~s}, \mathrm{CH})$, 127.06 (s, CH), 131.50 (s, C), 131.97 (s, C), 133.68 (s, C), 148.95 (s, C), 151.55 (s, C), 153.93 (s, C), 157.41 (s, C), 157.41 (s, C), 159.15 (s, C), 169.15 (s, C), 200.47 (s, CO); $m / z($ API ES+ $) 457\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 457.20440$ for $\mathrm{C}_{25} \mathrm{H}_{33} \mathrm{O}_{6} \mathrm{Si}$, $\mathrm{C}_{25} \mathrm{H}_{33} \mathrm{O}_{6} \mathrm{Si}$ requires [MH] ${ }^{+} 457.20409$.

3-(3-Hydroxy-4-methoxyphenyl)-4,5,6-trimethoxy-1H-inden-1-one 268 \& 2,3-Dihydro-3-(3-hydroxy-4-methoxyphenyl)-3,4,5,6-tetramethoxyinden-1-one 269

268

269

The method adopted was that of Wang ${ }^{230}$ et al. To a stirring solution of 4,5,6-trimethoxy-3-(4-methoxy-3-(methoxymethoxy)phenyl)-1H-inden-1-one 265 ( $0.040 \mathrm{~g}, 0.10 \mathrm{mmol}$ ) in methanol ( $3 \mathrm{~cm}^{3}$ ) under argon was added aqueous hydrochloric acid ( $0.6 \mathrm{~cm}^{3}, 3 \mathrm{M}$ ). The reaction was then heated to reflux at $75^{\circ} \mathrm{C}$ for 45 minutes. The reaction was cooled to room temperature and tipped into water ( $3 \mathrm{~cm}^{3}$ ), it was then extracted with dichloromethane ( $3 \times 10$ $\mathrm{cm}^{3}$ ). The organic fraction was then washed dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:19 to 2:3) afforded 268 as a red solid $(0.004 \mathrm{~g}, 0.01 \mathrm{mmol}, 12 \%)$ and then afforded 269 as a yellow gum $(0.011 \mathrm{~g}, 0.03 \mathrm{mmol}, 30 \%) ; \mathrm{R}_{\mathrm{f}} 0.12\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3412,2938$, $2838,1708,1595,1509,1467,1416,1334,1019,762 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.92(1 \mathrm{H}, \mathrm{d}, J 19.2 \mathrm{~Hz}, \mathrm{H}-2), 3.17(1 \mathrm{H}, \mathrm{d}, J 19.2 \mathrm{~Hz}, \mathrm{H}-2), 3.19\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.48(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.55\left(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-3{ }^{\prime}\right)$, $6.80\left(1 \mathrm{H}, \mathrm{d}, J 8.5 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 6.88\left(1 \mathrm{H}, \mathrm{dd}, J 2.0,8.5 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right), 6.90\left(1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime}\right)$, $7.08(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7) ; \delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 51.73\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 51.86\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $56.17\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.51\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 60.53\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.13\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 83.01(\mathrm{~s}, \mathrm{C}), 100.18(\mathrm{~s}$, CH ), 110.36 ( $\mathrm{s}, \mathrm{CH}$ ), 112.14 ( $\mathrm{s}, \mathrm{CH}), 116.89(\mathrm{~s}, \mathrm{CH}), 133.31(\mathrm{~s}, \mathrm{C}), 138.43$ (s, C), 141.22 (s, C), 145.52 (s, C), 145.60 ( s, C), 149.32 (s, C), 151.03 (s, C), 156.36 (s, C), 202.7 (s, CO) $m / z\left(\right.$ API-ES -) 373 ([M] ${ }^{-}, 100 \%$ ); HRMS found $[M H]^{+} 375.14396$ for $\mathrm{C}_{20} \mathrm{H}_{23} \mathrm{O}_{7}, \mathrm{C}_{20} \mathrm{H}_{23} \mathrm{O}_{7}$ requires $[\mathrm{MH}]^{+} 375.14383$.

## Chapter 6 - Experimental

(E)-1-(2-Bromo-3,4,5-trimethoxyphenyl)-3-(4-methoxy-3-nitrophenyl)prop-2-en-1-one 270

The chalcone 270 was obtained following Protocol A. Using 1-(2-bromo-3,4,5trimethoxyphenyl)ethanone 251 ( $1.04 \mathrm{~g}, 3.6 \mathrm{mmol}$ ), 4-methoxy-3-nitrobenzaldehyde 276 $(0.65 \mathrm{~g}, 3.6 \mathrm{mmol})$ and aqueous sodium hydroxide solution $\left(0.8 \mathrm{~cm}^{3}, 10 \mathrm{M}\right)$ in methanol ( 6.0 $\mathrm{cm}^{3}$ ). Recrystallization from methanol afforded 270 as yellow fluffy crystals ( $1.14 \mathrm{~g}, 2.5$ $\mathrm{mmol}, 70 \%) ;$ m.p. $95-110^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.24\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\max }\left(\mathrm{cm}^{-1}\right) 2942$, $2845,1662,1618,1600,1579,1562,1532,1498,1483,1459,1445,1427,1415,1343,1276$, 1001, 818; $\delta{ }^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.95\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.02\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.80(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6$ '), $7.48(1 \mathrm{H}, \mathrm{d}, J 16.2 \mathrm{~Hz}, \mathrm{H}-2)$, 7.14 ( $1 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-5^{\prime}{ }^{\prime}$ ), 7.44 ( $1 \mathrm{H}, \mathrm{d}, J 16.2 \mathrm{~Hz}, \mathrm{H}-3$ ), 7.76 ( $1 \mathrm{H}, \mathrm{dd}, J 2.1,8.7 \mathrm{~Hz}, \mathrm{H}-$ $6^{\prime \prime}$ ), 8.06 ( $1 \mathrm{H}, \mathrm{d}, J 2.1 \mathrm{~Hz}, \mathrm{H}-2$ ''); $\delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $56.33\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $56.85\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.23\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.25\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.60(\mathrm{~s}, \mathrm{CBr}), 108.07(\mathrm{~s}, \mathrm{CH}), 113.97$ (s, CH), 125.56 ( $\mathrm{s}, \mathrm{CH}$ ), 126.32 ( $\mathrm{s}, \mathrm{CH}$ ), $127.21(\mathrm{~s}, \mathrm{C}), 133.99(\mathrm{~s}, \mathrm{CH}), 136.47(\mathrm{~s}, \mathrm{C}), 139.85$ (s, C), 142.39 ( $\mathrm{s}, \mathrm{CH}$ ), 144.96 ( $\mathrm{s}, \mathrm{C}$ ), 151.13 ( $\mathrm{s}, \mathrm{C}$ ), 153.13 ( $\mathrm{s}, \mathrm{C}$ ), 154.41 ( $\mathrm{s}, \mathrm{C}), 193.29$ (s, $\mathrm{CO}) ; m / z(\mathrm{AP}+) 452\left(\mathrm{MH}^{+}, 100 \%\right), 454\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 452.03438$ for $\mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{7} \mathrm{NBr}, \mathrm{C}_{19} \mathrm{H}_{19} \mathrm{O}_{7} \mathrm{NBr}$ requires $[\mathrm{MH}]^{+} 452.03394$; CHN found $\mathrm{C} 50.28 \%, \mathrm{H} 3.96 \%, \mathrm{~N}$ 2.95\% CHN requires C 50.46\%, H 4.01\%, N 3.10\%.

(E)-1-(2-Bromo-3,4,5-trimethoxyphenyl)-3-(3,4-dichlorophenyl)prop-2-en-1-one 275

The chalcone 275 was obtained following Protocol A. Using 1-(2-bromo-3,4,5trimethoxyphenyl)ethanone $251(1.08 \mathrm{~g}, 3.7 \mathrm{mmol})$, 3,4-dichlorobenzaldehyde ( $0.66 \mathrm{~g}, 3.7$ mmol ) and aqueous sodium hydroxide solution $\left(0.8 \mathrm{~cm}^{3}, 10 \mathrm{M}\right)$ in methanol ( $3.0 \mathrm{~cm}^{3}$ ). Recrystallization from methanol afforded 275 as white crystals ( $1.14 \mathrm{~g}, 2.6 \mathrm{mmol}, 71 \%$ ); m.p. $122-124{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.87\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 1\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3055,2940,1643$, $1622,1587,1552,1477,1466,1426,1386,1261,1202,1160,1099,994,908,855,822 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.95\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.97\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 6.82 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6^{\prime}$ ), 7.13 ( $1 \mathrm{H}, \mathrm{d}, J 16.0 \mathrm{~Hz}, \mathrm{H}-2$ ), $7.39-7.46$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$ \& H-6'), $7.50(1 \mathrm{H}$, d, $J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}$ '), 7.67 ( $1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}, \mathrm{H}-\mathbf{2}^{\prime}$ ) ; $\delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.32$ $\left(\mathrm{s}, \mathrm{OCH}_{3}\right), 61.23\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.26\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.68(\mathrm{~s}, \mathrm{CBr}), 108.15(\mathrm{~s}, \mathrm{CH}), 127.40(\mathrm{~s}$, CH ), 127.46 ( $\mathrm{s}, \mathrm{CH}$ ), 130.06 ( $\mathrm{s}, \mathrm{CH}$ ), $131.02(\mathrm{~s}, \mathrm{CH}), 133.39(\mathrm{~s}, \mathrm{C}), 134.57(\mathrm{~s}, \mathrm{C}), 134.72(\mathrm{~s}$, C), 136.39 ( $\mathrm{s}, \mathrm{C}$ ), 142.42 ( $\mathrm{s}, \mathrm{CH}$ ), 145.04 ( $\mathrm{s}, \mathrm{C}), 151.12$ ( $\mathrm{s}, \mathrm{C}), 153.12$ ( $\mathrm{s}, \mathrm{C}), 193.27$ ( $\mathrm{s}, \mathrm{CO}$ ); $m / z(\mathrm{AP}+) 445\left(\mathrm{MH}^{+}, 50 \%\right), 447\left(\mathrm{MH}^{+}, 100 \%\right), 449\left(\mathrm{MH}^{+}, 50 \%\right)$; HRMS found [MH] ${ }^{+}$ 444.9606 for $\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{O}_{4} \mathrm{Cl}_{2} \mathrm{Br}, \mathrm{C}_{18} \mathrm{H}_{15} \mathrm{O}_{4} \mathrm{Cl}_{2} \mathrm{Br}$ requires [MH] ${ }^{+} 444.9605$; CHN found C 48.42\%, H 3.32\% CHN requires C $48.46 \%$, H 3.39\%.

4,5,6-Trimethoxy-3-(4-methoxy-3-nitrophenyl)-1H-inden-1-one 282

282
In 5 individual pressure-rated reaction vial $\left(10 \mathrm{~cm}^{3}\right.$ ), a mixture of ( $E$ )-1-(2-bromo-3,4,5-trimethoxyphenyl)-3-(4-methoxy-3-nitrophenyl)prop-2-en-1-one 270 ( $0.100 \mathrm{~g}, 0.22 \mathrm{mmol}$ ), potassium carbonate ( $0.076 \mathrm{~g}, 0.55 \mathrm{mmol}$ ), palladium(II) chloride ( $0.001 \mathrm{~g}, 0.0056 \mathrm{mmol}$ ) and triphenylphosphine ( $0.005 \mathrm{~g}, 0.019 \mathrm{mmol}$ ) was dissolved in anhydrous dimethyl formamide ( $1.7 \mathrm{~cm}^{3}$ ) and sealed. Each reaction vial was then irradiated in a self-turning single-mode CEM Discovery ${ }^{\text {TM }}$ Focused Synthesizer. The reaction was maintained at $160{ }^{\circ} \mathrm{C}$ (power: 150 W ) for 15 minutes. The vials were then rapidly cooled to room temperature,

## Chapter 6 - Experimental

then had water $\left(1.8 \mathrm{~cm}^{3}\right)$ added to each vial and left at room temperature overnight. The precipitate from each vial was then filtered off, washed with water $\left(5 \times 3 \mathrm{~cm}^{3}\right)$. The combined wet solid was then dissolved in ethyl acetate $\left(5 \mathrm{~cm}^{3}\right)$, and was heated to $65^{\circ} \mathrm{C}$ with an aqueous potassium thiocyanate solution $\left(1.5 \mathrm{~cm}^{3}, 2 \mathrm{M}\right)$ under argon for 1 hour. The mixture was then cooled to room temperature and extracted with dichloromethane ( $30 \mathrm{~cm}^{3}$ ), the combined organic fractions were then washed with water ( $10 \mathrm{~cm}^{3}$ ) and brine ( $2 \times 15 \mathrm{~cm}^{3}$ ) then dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Recrystallization from ethyl acetate afforded 282 as dark red crystals ( $0.127 \mathrm{~g}, 0.34 \mathrm{mmol}, 31 \%$ ); m.p. 155 $159{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.34\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2958(\mathrm{~m}), 1694(\mathrm{~s}), 1617(\mathrm{~s})$, 1566 (m), 1526 ( s), 1497 ( s$), 1466$ ( s$), 1411$ ( s$), 1356$ ( s$), 1283$ ( s$), 1113$ ( s$), 1027$ ( s$) ; \delta^{1} \mathrm{H}$ NMR ( $\left.400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.85\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $4.04\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.79(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 7.02(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7), 7.14(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5$ '), 7.85 ( $1 \mathrm{H}, \mathrm{dd}, J 2.3,8.4 \mathrm{~Hz}, \mathrm{H}-6^{\prime}$ ), $8.23\left(1 \mathrm{H}, \mathrm{d}, J 2.3 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3}$; $\mathrm{ppm}) 56.73\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.94\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.36\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.60\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 105.02(\mathrm{~s}, \mathrm{CH})$, 113.00 ( $\mathrm{s}, \mathrm{CH}$ ), 123.90 ( $\mathrm{s}, \mathrm{CH}$ ), 125.76 ( $\mathrm{s}, \mathrm{CH}$ ), 126.61 ( $\mathrm{s}, \mathrm{C}), 126.79$ ( $\mathrm{s}, \mathrm{C}), 128.47$ (s, C), 133.91 (s, CH), 139.31 (s, C), 147.14 (s, C), 149.19 (s, C), 154.03 (s, C), 155.18 (s, C), 161.74 (s, C), 195.46 ( $\mathrm{s}, \mathrm{CO}$ ); m/z(API ES+ $) 372\left(\mathrm{MH}^{+}, 100 \%\right.$ ); HRMS found [MH] ${ }^{+}$ 372.10805 for $\mathrm{C}_{19} \mathrm{H}_{18} \mathrm{NO}_{7}, \mathrm{C}_{19} \mathrm{H}_{18} \mathrm{NO}_{7}$ requires $[\mathrm{MH}]^{+} 372.10778$.

## 3-(3-Fluoro-4-methoxyphenyl)-4,5,6-trimethoxy-1H-inden-1-one 277

277
The indenone 277 was obtained following Protocol D. Using ( $E$ )-1-(2-bromo-3,4,5-trimethoxyphenyl)-3-(3-fluoro-4-methoxyphenyl)prop-2-en-1-one 271 ( $0.43 \mathrm{~g}, 1.01 \mathrm{mmol}$ ). ## 4-Methoxy-3-nitrobenzaldehyde $276{ }^{349}$

276
To stirred mixture of concentrated nitric acid $\left(5.3 \mathrm{~cm}^{3}, 83.0 \mathrm{mmol}\right)$ and concentrated sulfuric acid $\left(150 \mathrm{~cm}^{3}\right)$ at $-15^{\circ} \mathrm{C}$, was added p -anisaldehyde $\left(9.8 \mathrm{~cm}^{3}, 80.7 \mathrm{mmol}\right)$. The reaction was then stirred at $-15^{\circ} \mathrm{C}$ for an hour, the solution turns a golden brown colour. The mixture was then tipped into cold water $\left(500 \mathrm{~cm}^{3}\right)$ and chilled to $0^{\circ} \mathrm{C}$ for an hour. The cream precipitate was then filtered, washed with water ( $100 \mathrm{~cm}^{3}$ ). Recrystallization from ethanol ( $\sim 100 \mathrm{~cm}^{3}$ ) afforded 276 as cream crystals $(10.06 \mathrm{~g}, 55.6 \mathrm{mmol}, 69 \%) ;$ m.p. $77-79{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.32\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3) ; v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 3074,2873,1704,1682,1610,1569,1530,1497,1468$, 1446, 1424, 1352, 1280, 1206, 1153, 1001, 684; $\delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) 4.07 $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.24\left(1 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 8.09(1 \mathrm{H}, \mathrm{dd}, J 2.0,8.8 \mathrm{~Hz}, \mathrm{H}-6$ '), $8.35(1 \mathrm{H}, \mathrm{d}, J$ $2.0 \mathrm{~Hz}, \mathrm{H}-2$ ), $9.94(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 57.31\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, 114.06 ( $\mathrm{s}, \mathrm{CH}$ ), 127.65 ( $\mathrm{s}, \mathrm{CH}$ ), 129.29 ( $\mathrm{s}, \mathrm{C}$ ), 134.94 ( $\mathrm{s}, \mathrm{CH}$ ), 157.38 ( $\mathrm{s}, \mathrm{C}$ ), 188.96 (s, CO).

## Chapter 6 - Experimental

1-(2-Bromo-3,4,5-trimethoxyphenyl)propan-1-ol 284

284
To a stirring solution of ethylmagnesium chloride in tetrahydrofuran $\left(10.5 \mathrm{~cm}^{3}, 21.0 \mathrm{mmol}\right.$, $2 \mathrm{M})$ in anhydrous tetrahydrofuran $\left(10 \mathrm{~cm}^{3}\right)$ under argon at $0^{\circ} \mathrm{C}$, was slowly added 2-bromo-3,4,5-trimethoxybenzaldehyde $252(3.07 \mathrm{~g}, 11.2 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( 20 $\mathrm{cm}^{3}$ ). The reaction was then stirred overnight at room temperature and then poured into mixture of concentrated aqueous ammonium chloride solution ( $100 \mathrm{~cm}^{3}$ ) and ice, and then extracted with ethyl acetate ( $6 \times 20 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:9) afforded 284 as a yellow oil ( $1.99 \mathrm{~g}, 6.5 \mathrm{mmol}, 58 \%$ ); $\mathrm{R}_{\mathrm{f}}$ $0.71\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $\delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $1.02(3 \mathrm{H}, \mathrm{t}, J 7.4$ $\mathrm{Hz}, \mathrm{H}-3), 1.62-1.70(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2), 1.76-1.84(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2), 1.97(1 \mathrm{H}, \mathrm{d}, J 3.4 \mathrm{~Hz}, \mathrm{OH}-1)$, $3.87\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89\left(3 \mathrm{H}, \mathrm{OCH}_{3}\right), 4.98-5.03(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-1) 6.94\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2^{\prime}\right)$.

## 1-(2-Bromo-3,4,5-trimethoxyphenyl)propan-1-one 283

283
Pyridinium chlorochromate $(2.19 \mathrm{~g}, 10.2 \mathrm{mmol})$ was added to a stirred solution of 1-(2-bromo-3,4,5-trimethoxyphenyl)propan-1-ol 284 ( $1.99 \mathrm{~g}, 6.5 \mathrm{mmol}$ ) in dichloromethane ( 20 $\mathrm{cm}^{3}$ ). The reaction was then put under argon gas and stirred at room temperature under argon overnight. It was then filtered through Celite ${ }^{\circledR}$, dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:3) afforded 283 as cream crystals ( $1.73 \mathrm{~g}, 1.9 \mathrm{mmol}, 88 \%$ ); m.p. $62-63{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.64\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\max .}\left(\mathrm{cm}^{-1}\right) 2972,2938,2895,1698,1582,1563,1482,1447,1430$, $1401,1384,1351,1318,1167,999,857,793 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $1.15(3 \mathrm{H}$, $\mathrm{t}, J 7.2 \mathrm{~Hz}, \mathrm{H}-3), 2.85(2 \mathrm{H}, \mathrm{q}, J 7.2 \mathrm{~Hz}, \mathrm{H}-2), 3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.84$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.63\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6\right.$ ) ; $\delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 8.29\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 36.23$ (s, $\mathrm{CH}_{2}$ ), $56.27\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.12\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 61.18\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 105.65(\mathrm{~s}, \mathrm{CBr}), 107.10(\mathrm{~s}, \mathrm{CH})$, 137.81 ( $\mathrm{s}, \mathrm{C}$ ), 144.62 ( $\mathrm{s}, \mathrm{C}$ ), 151.07 ( $\mathrm{s}, \mathrm{C}), 152.96(\mathrm{~s}, \mathrm{C}), 204.99(\mathrm{~s}, \mathrm{CO}) ; m / z(\mathrm{AP}+) 303\left(\mathrm{MH}^{+}\right.$,

## Chapter 6 - Experimental

$100 \%), 305\left(\mathrm{MH}^{+}, 80 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 303.02254$ for $\mathrm{C}_{12} \mathrm{H}_{16} \mathrm{BrO}_{4}, \mathrm{C}_{12} \mathrm{H}_{16} \mathrm{BrO}_{4}$ requires $[\mathrm{MH}]^{+} 303.02265$.

## (E)-1-(2-Bromo-3,4,5-trimethoxyphenyl)-3-(4-methoxyphenyl)-2-methylprop-2-en-1-one 285

The method adopted was that of Edwards ${ }^{72}$ et al. A solution of 1-(2-bromo-3,4,5-trimethoxyphenyl)propan-1-one $283(0.92 \mathrm{~g}, 3.0 \mathrm{mmol})$, p-anisaldehyde $\left(0.35 \mathrm{~cm}^{3}, 3.1\right.$ mmol ), piperidine ( $1.2 \mathrm{~cm}^{3}$ ) and acetic acid $\left(0.6 \mathrm{~cm}^{3}\right)$ in ethanol $\left(3.5 \mathrm{~cm}^{3}\right)$ was heated at reflux at $110^{\circ} \mathrm{C}$ under argon for 7 days. The mixture was then cooled to room temperature and diluted with dichloromethane $\left(30 \mathrm{~cm}^{3}\right)$ and washed with water $\left(3 \times 10 \mathrm{~cm}^{3}\right)$. The aqueous fraction was then extracted with dichloromethane $\left(3 \times 10 \mathrm{~cm}^{3}\right)$. The organic fractions were then combined and dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right)$ afforded a mixture of $\mathbf{2 8 3}$ and $p$-anisaldehyde (2.9:1), the mixture was shaken in deuterated chloroform $\left(15 \mathrm{~cm}^{3}\right)$ in the presence of the scavenger agent PS-trisamine $(1.18 \mathrm{~g}, 5.36 \mathrm{mmol})$ at room temperature for 2 hours, reaction monitored by ${ }^{1} \mathrm{H}$ NMR. The mixture was, filtered and evaporated in vacuo to afforded 285 as yellow oil ( $0.78 \mathrm{~g}, 1.8 \mathrm{mmol}, 61 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.32\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2937,2839,1648,1599,1565,1509,1479,1462,1426$, $1382,1333,1251,1174,1005,828 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.25\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$, $3.84\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.86\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.93\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.94\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.65(1 \mathrm{H}, \mathrm{s}$, H-6'), 6.93 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3$ '" \& H-5' $), 7.09$ ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3$ ), 7.40 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-2$ '" \& H-6' ${ }^{\prime}$ ) $\delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 12.87\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 55.35\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.25(\mathrm{~s}$, $\left.\mathrm{OCH}_{3}\right), 61.18\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.24(\mathrm{~s}, \mathrm{CBr}), 107.46(\mathrm{~s}, \mathrm{CH}), 114.01(\mathrm{~s}, \mathrm{CH}), 128.111(\mathrm{~s}, \mathrm{C})$, 131.99 (s, CH), 134.44 (s, C), 137.08 (s, C), 143.69 (s, C), 145.41 (s, CH), 150.90 (s, C), 152.96 (s, C), 160.39 (s, C), 198.13 (s, CO); $m / z\left(\mathrm{AP}+\right.$ ) $421\left(\mathrm{MH}^{+}, 100 \%\right), 423\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 421.06569$ for $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{BrO}_{5}, \mathrm{C}_{20} \mathrm{H}_{22} \mathrm{BrO}_{5}$ requires [MH] ${ }^{+} 421.06451$; CHN found C $55.78 \%$, H $6.16 \%$, CHN requires C $55.86 \%$, H $6.19 \%$.

## Chapter 6 - Experimental

1-(2-(Allyloxy)-4-methoxyphenyl)ethanone $\mathbf{3 3 0}^{262}$

330
The method adopted was that of Anjaneyulu ${ }^{262}$ et al.To a stirring solution of 2-hydroxy-4methoxyacetophenone ( $1.66 \mathrm{~g}, 10.0 \mathrm{mmol}$ ), and potassium carbonate ( $5.00 \mathrm{~g}, 36.2 \mathrm{mmol}$ ) in acetone $\left(10 \mathrm{~cm}^{3}\right)$ at room temperature, was added allyl bromide ( $1.72 \mathrm{~cm}^{3}, 19.9 \mathrm{mmol}$ ). The mixture was then put under argon and heated to reflux overnight at $75^{\circ} \mathrm{C}$. The reaction was then cooled to room temperature and filtered to remove the potassium carbonate, and then the acetone was evaporated in vacuo. The crude product was then diluted with ethyl acetate (30 $\mathrm{cm}^{3}$ ) and washed with an aqueous sodium hydroxide solution ( $3 \times 20 \mathrm{~cm}^{3}, 1.3 \mathrm{M}$ ) and water ( $3 \times 20 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo to afforded 330 as a white solid ( $2.05 \mathrm{~g}, 10.0 \mathrm{mmol}, 99 \%$ ); m.p. 36 $37{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.36$ ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:3); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 3090,2988,2928,2846,1647$, 1597, 1572, 1501, 1480, 1465, 1465, 1439, 1419, 1326, 1201, 1010, 923, 827; $\delta{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 2.59(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.60(2 \mathrm{H}, \mathrm{td}, J 1.5,5.3 \mathrm{~Hz}$, H-1'’), $5.32(1 \mathrm{H}, \mathrm{dq}, J 10.6,1.5 \mathrm{~Hz}$, cis H-3'’), $5.44(1 \mathrm{H}, \mathrm{dq}, J 17.2,1.5 \mathrm{~Hz}$, trans H-3'’), 6.18 ( 1 H, tdd, $\left.J 5.3,10.6,17.2 \mathrm{~Hz}, \mathrm{H}-2^{\prime}{ }^{\prime}\right), 6.43\left(1 \mathrm{H}, \mathrm{d}, J 2.4 \mathrm{~Hz}, \mathrm{H}-3^{\prime}\right), 6.51(1 \mathrm{H}, \mathrm{dd}, J 2.4$, $\left.8.9 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 7.83\left(1 \mathrm{H}, \mathrm{d}, J 8.9 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right) ; \delta^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 32.28$ (s, $\mathrm{CH}_{3}$ ), $55.74\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 69.66\left(\mathrm{~s}, \mathrm{OCH}_{2}\right), 99.60(\mathrm{~s}, \mathrm{CH}), 105.57(\mathrm{~s}, \mathrm{CH}), 118.53\left(\mathrm{~s}, \mathrm{CH}_{2}\right)$, 121.65 (s, C), 132.74 (s, CH), 132.90 (s, CH), 160.25 (s, C), 164.59 (s, C), 197.98 (s, CO); $m / z(A P I E S+) 207\left(\mathrm{MH}^{+}, 100 \%\right)$.

1-(3-Allyl-2-hydroxy-4-methoxyphenyl)ethanone $\mathbf{3 2 6}^{262}$

326
The method was adapted from that of Anjaneyulu ${ }^{262}$ et al. 1-(2-(allyloxy)-4-methoxyphenyl) ethanone $330(0.50 \mathrm{~g}, 2.4 \mathrm{mmol})$ was dissolved in $N, N$-dimethylaniline $\left(5 \mathrm{~cm}^{3}\right)$ and sealed in a pressure-rated reaction vial $\left(10 \mathrm{~cm}^{3}\right)$. The reaction vial was then irradiated in a self-turning single-mode CEM Discovery ${ }^{\text {TM }}$ Focused Synthesizer. The reaction was maintained at $260{ }^{\circ} \mathrm{C}$ (power: 250 W ) for 12 minutes. The mixture was then rapidly cooled to room temperature

## Chapter 6 - Experimental

and poured into hydrochloric acid ( $50 \mathrm{~cm}^{3}, 2 \mathrm{M}$ ) and extracted with ethyl acetate ( $5 \times 10 \mathrm{~cm}^{3}$ ). The organic fraction as then washed with hydrochloric acid $\left(5 \times 10 \mathrm{~cm}^{3}, 2 \mathrm{M}\right)$ and saturated sodium bicarbonate aqueous solution ( $10 \mathrm{~cm}^{3}$ ), it was then dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Purification by column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:9) afforded 326 as a cream solid ( $0.33 \mathrm{~g}, 1.6 \mathrm{mmol}, 66 \%$ ); m.p. 49 $51{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.48\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3002,2949,2914,2842,1608$, $1496,1466,1414,1366,1268,1123,1070,995,918,818 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3}$; ppm) $2.57(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 3.42\left(2 \mathrm{H}, \mathrm{td}, J 1.7,6.1 \mathrm{~Hz}, \mathrm{H}-1{ }^{\prime}{ }^{\prime}\right), 3.89\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.93-4.98$ ( $1 \mathrm{H}, \mathrm{dm}, J 10.1 \mathrm{~Hz}$, cis-H-3'’), $4.97-5.04$ ( $1 \mathrm{H}, \mathrm{dm}, J 17.0 \mathrm{~Hz}$, trans-H-3''), 5.95 ( 1 H , ddt, $J$ $10.1,17.0,6.1 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ) $, 6.47\left(1 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 7.64(1 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-6$ '), 12.77 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{OH}-2^{\prime}$ ); $\delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $26.49\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 26.77\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 56.07(\mathrm{~s}$, $\mathrm{OCH}_{3}$ ), 102.31 (s, CH), $144.58(\mathrm{~s}, \mathrm{C}), 144.70\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 115.68(\mathrm{~s}, \mathrm{C}), 130.86(\mathrm{~s}, \mathrm{CH}), 136.10$ (s, CH), 162.09 (s, C), 163.59 (s, C), 203.13 (s, CO).

1-(3-Allyl-4-methoxy-2-(methoxymethoxy)phenyl)ethanone 331

331
To a stirring solution of 1-(3-allyl-2-hydroxy-4-methoxyphenyl)ethanone 326 ( $1.00 \mathrm{~g}, 4.8$ $\mathrm{mmol})$ in anhydrous tetrahydrofuran $\left(10 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$ under argon, sodium hydride $(0.29 \mathrm{~g}$, $7.3 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) was added. The reaction was then stirred for 5 minutes at $0{ }^{\circ} \mathrm{C}$, before adding Chloromethyl methyl ether ( $0.56 \mathrm{~cm}^{3}, 7.4 \mathrm{mmol}$ ) to the mixture. The reaction was then stirred for a further 10 minutes at $0^{\circ} \mathrm{C}$. The reaction was then heated to $65{ }^{\circ} \mathrm{C}$ for 18 hours. The reaction was then allowed to cool to room temperature; it was then tipped into water $\left(10 \mathrm{~cm}^{3}\right)$ and extracted with ethyl acetate ( $3 \times 15$ $\mathrm{cm}^{3}$ ). The organic fraction was then washed with water $\left(2 \times 10 \mathrm{~cm}^{3}\right)$ and dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 9\right)$ afforded 331 as a yellow oil $(0.52 \mathrm{~g}, 2.1$ $\mathrm{mmol}, 43 \%) ; \mathrm{R}_{\mathrm{f}} 0.54\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2941,2840,1675,1588$, $1482,1465,1427,1264,972,921,806 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $2.58(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-$ 2), $3.48\left(2 \mathrm{H}, \mathrm{td}, J 1.6,5.6 \mathrm{~Hz}, \mathrm{H}-1\right.$ ''), $3.52\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-4^{\prime \prime}{ }^{\prime \prime}\right), 3.89\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 4.96(2 \mathrm{H}, \mathrm{s}$, H-2'"'), $4.95-5.01$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-3^{\prime \prime}$ ), $5.92-6.03$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2$ ''), 6.71 ( $1 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-5$ '), 7.57 ( $1 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-6^{\prime}$ ); $\delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $28.46\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 30.25$ (s,

Chapter 6 - Experimental
$\mathrm{CH}), 56.09\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 58.07\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 101.60\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right), 115.12\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 122.86(\mathrm{~s}, \mathrm{C})$, 127.06 (s, C), 129.65 (s, CH), 136.51 (s, CH), 156.00 (s, C), 161.83 (s, C), 199.59 (s, CO); $m / z$ (API ES + ) $251\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 251.12800$ for $\mathrm{C}_{14} \mathrm{H}_{19} \mathrm{O}_{4}, \mathrm{C}_{14} \mathrm{H}_{19} \mathrm{O}_{4}$ requires $[\mathrm{MH}]^{+}$251.12779.

## 4-(Methoxymethoxy) benzaldehyde $\mathbf{3 3 2}^{350}$

332
The method was adapted from that of Crombie ${ }^{228}$ et al. To a stirring solution of sodium hydride ( $0.81 \mathrm{~g}, 20.3 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) in anhydrous dimethyl formamide $\left(10 \mathrm{~cm}^{3}\right)$ at $0{ }^{\circ} \mathrm{C}$ under argon 4-methoxybenzaldeyde ( $2.00 \mathrm{~g}, 16.4 \mathrm{mmol}$ ) in anhydrous dimethyl formamide ( $10 \mathrm{~cm}^{3}$ ) was added slowly drop wise over 20 minutes. The reaction was then allowed to warm to room temperature, before being cooled to $0^{\circ} \mathrm{C}$. Chloromethyl methyl ether ( $1.5 \mathrm{~cm}^{3}, 19.7 \mathrm{mmol}$ ) in anhydrous dimethyl formamide ( $4 \mathrm{~cm}^{3}$ ) was then added drop wise over 20 minutes to the mixture at $0^{\circ} \mathrm{C}$. The mixture was then stirred for 30 minutes at $0^{\circ} \mathrm{C}$ and then stirred overnight at room temperature. The reaction was then tipped into a mixture of water $\left(20 \mathrm{~cm}^{3}\right)$ and ice ( 20 g ), and extracted with ethyl acetate ( $4 \times 30 \mathrm{~cm}^{3}$ ). The organic fraction was washed with an aqueous sodium hydroxide solution $\left(2 \times 10 \mathrm{~cm}^{3}, 0.1\right.$ $\mathrm{M})$ and water ( $2 \times 10 \mathrm{~cm}^{3}$ ), it was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:9 to $1: 1$ ) afforded 332 as a pale yellow oil $(2.30 \mathrm{~g}, 13.8 \mathrm{mmol}, 84 \%) ; \mathrm{R}_{\mathrm{f}} 0.46\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2903,2829,2741,1684,1597,1578,1508,1444,1427,1237$, $1213,1201,1079,974,921,831 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.49\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, 5.25 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-\mathbf{2}^{\prime}$ ) , 7.15 ( $2 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-3^{\prime} \& \mathrm{H}-5^{\prime}$ ), 7.84 ( $2 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ \& H-6’), $9.90(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1) ; \delta{ }^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.58\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 94.33\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right)$, 116.50 (s, CH), 130.97 (s, C), 132.10 (s, CH), 162.43 ( s, C), 191.12 (s, CHO).

1-(2,4-Dimethoxy-3-(3-methylbut-2-enyl)phenyl)ethanone 347 ${ }^{352}$

347
The acetophenone 347 was obtained following Protocol E. Using 1-(3-allyl-2,4dimethoxyphenyl)ethanone 346 ( $1.0 \mathrm{~g}, 4.5 \mathrm{mmol}$ ), 2-methybut-2-ene ( $9.1 \mathrm{~cm}^{3}, 85.6 \mathrm{mmol}$ ) and Grubbs catalyst, $2^{\text {nd }}$ generation ( $0.077 \mathrm{~g}, 0.0905 \mathrm{mmol}$ ) in anhydrous dichloromethane $\left(65 \mathrm{~cm}^{3}\right)$. Purification by column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 19$ to $1: 3$ ) afforded 347 as a light brown oil ( $1.1 \mathrm{~g}, 4.5 \mathrm{mmol}, 98 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.47\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3) ; v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2939,1671,1586,1482,1455,1409,1265,807 ; \delta{ }^{1} \mathrm{H}$ NMR ( 400 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 1.68\left(3 \mathrm{H}, \mathrm{d}, J 1.2 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 1.78\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.61(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 3.37(2 \mathrm{H}, \mathrm{d}, J$ $6.9 \mathrm{~Hz}, \mathrm{H}-1$ ''), $3.74\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.87\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.13-5.20(1 \mathrm{H}, \mathrm{tm}, J 6.9 \mathrm{~Hz}, \mathrm{H}-$ $2^{\prime}$ ), $6.69\left(1 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-5^{\prime}\right), 7.60\left(1 \mathrm{H}, \mathrm{d}, J 8.6 \mathrm{~Hz}, \mathrm{H}-6\right.$ '); $\delta{ }^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 18.08\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 23.06\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 25.97\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 30.23\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 56.04\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$, $63.05\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 106.47(\mathrm{~s}, \mathrm{CH}), 122.79(\mathrm{~s}, \mathrm{CH}), 124.37(\mathrm{~s}, \mathrm{C}), 126.09(\mathrm{~s}, \mathrm{C}), 129.65(\mathrm{~s}, \mathrm{CH})$, 131.97 (s, C), 159.39 (s, C), 162.14 (s, C), 199.36 (s, CO).

## Protocol F

To a stirring solution of substituted acetophenone and substituted benzaldehyde in methanol was added a quantity of an aqueous solution of sodium hydroxide and the mixture stirred at room temperature overnight. The mixture was then extracted with ethyl acetate or chloroform or dichloromethane, the organic fraction was then washed with water, dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. The chalcone was then isolated by column chromatography or recrystallization.
(E)-1-(3-Allyl-2,4-dimethoxyphenyl)-3-(4-methoxyphenyl)prop-2-en-1-one 348

348
The chalcone 348 was obtained by following Protocol F. Using 1-(3-allyl-2,4dimethoxyphenyl)ethanone $346(0.087 \mathrm{~g}, 0.39 \mathrm{mmol})$, $p$-anisaldehyde in methanol $\left(0.39 \mathrm{~cm}^{3}\right.$, $1 \mathrm{M})$, and aqueous sodium hydroxide solution $\left(0.39 \mathrm{~cm}^{3}, 2 \mathrm{M}\right)$ in methanol $\left(1.2 \mathrm{~cm}^{3}\right)$. The mixture was extracted with ethyl acetate $\left(2 \times 5 \mathrm{~cm}^{3}\right)$ and washed with water $\left(2 \times 5 \mathrm{~cm}^{3}\right)$.

## 3-Methoxy-4-(methoxymethoxy)benzaldehyde $\mathbf{3 6 5}{ }^{533}$

365

The method was adapted from that of Crombie ${ }^{228}$ et al. To a stirring solution of sodium hydride ( $0.16 \mathrm{~g}, 4.0 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) in anhydrous dimethyl formamide $\left(2 \mathrm{~cm}^{3}\right)$ at $0{ }^{\circ} \mathrm{C}$ under argon 4-hydroxy-3-methoxybenzaldeyde ( $0.50 \mathrm{~g}, 3.3 \mathrm{mmol}$ ) in anhydrous dimethyl formamide $\left(2 \mathrm{~cm}^{3}\right)$ was added slowly drop wise over 20 minutes. The reaction was then allowed to warm to room temperature, before being cooled to $0{ }^{\circ} \mathrm{C}$.

## Chapter 6 - Experimental

Chloromethyl methyl ether $\left(0.30 \mathrm{~cm}^{3}, 3.9 \mathrm{mmol}\right)$ in anhydrous dimethyl formamide $\left(1 \mathrm{~cm}^{3}\right)$ was then added drop wise over 30 minutes to the mixture at $0^{\circ} \mathrm{C}$. The mixture was then stirred for 30 minutes at $0^{\circ} \mathrm{C}$ and then stirred overnight at room temperature. The reaction was then tipped into a mixture of water $\left(5 \mathrm{~cm}^{3}\right)$ and ice $(5 \mathrm{~g})$, and extracted with ethyl acetate $\left(4 \times 6 \mathrm{~cm}^{3}\right.$ ). The organic fraction was washed with an aqueous sodium hydroxide solution (2 $\times 3 \mathrm{~cm}^{3}, 0.1 \mathrm{M}$ ) and water ( $2 \times 3 \mathrm{~cm}^{3}$ ), it was then dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Purification by column chromatography ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane 1:9 to $1: 3$ ) afforded 365 as pale yellow oil ( $0.51 \mathrm{~g}, 2.6 \mathrm{mmol}, 80 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.22$ ( $\mathrm{SiO}_{2}$, ethyl acetate:hexane $1: 3$ ); $v_{\text {max }} .\left(\mathrm{cm}^{-1}\right) 2956,2932,2872,2829,1680,1596,1586,1506,1466$, $1451,1442,1421,1259,1230,1150,1126,1082,919,868,817,728 ; ~ \delta{ }^{1} \mathrm{H}$ NMR ( 400 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.53\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.96\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.37\left(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-2{ }^{\prime}\right)$ ), $7.28(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 8.8$ $\mathrm{Hz}, \mathrm{H}-5^{\prime}$ ), $7.42-7.45$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-\mathbf{2}^{\prime}$ \& H-6'), $9.88(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1) ; \delta{ }^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 56.27\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 56.76\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 95.24\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right), 109.73(\mathrm{~s}, \mathrm{CH}), 114.91$ (s, CH), 126.67 (s, CH), 131.30 (s, C), 150.30 (s, C), 152.23 (s, C), 191.24 (s, CHO).
(E)-1-(2,4-Dimethoxy-3-(3-methylbut-2-enyl)phenyl)-3-(4-methoxyphenyl)prop-2-en-1-one 356

356
The chalcone 356 was obtained by following Protocol F. Using 1-(2,4-dimethoxy-3-(3-methylbut-2-enyl)phenyl)ethanone $347(0.087 \mathrm{~g}, 0.35 \mathrm{mmol})$, $p$-anisaldehyde in methanol ( $0.35 \mathrm{~cm}^{3}, 1 \mathrm{M}$ ), and aqueous sodium hydroxide solution ( $0.35 \mathrm{~cm}^{3}, 2 \mathrm{M}$ ) in methanol ( 1.4 $\mathrm{cm}^{3}$ ). ## Protocol G

The method adopted was that of Wang ${ }^{230}$ et al. To a stirring solution of MOM-protected compound in methanol under argon was added hydrochloric acid (3M). The reaction was then heated to reflux at $75^{\circ} \mathrm{C}$ for 45 minutes. The reaction was cooled to room temperature and tipped into water $\left(6 \mathrm{~cm}^{3}\right)$, it was then extracted with ethyl acetate $\left(3 \times 6 \mathrm{~cm}^{3}\right)$. The organic fraction was then washed with water $\left(2 \times 5 \mathrm{~cm}^{3}\right)$, dried over anhydrous sodium sulfate, filtered and evaporated in vacuo. Purified by column chromatography or recrystallization.

## (E)-1-(3-Allyl-2,4-dimethoxyphenyl)-3-(4-hydroxyphenyl)prop-2-en-1-one 367

(E)-1-(3,4-Dichlorophenyl)-3-(4-hydroxyphenyl)prop-2-en-1-one 391 ${ }^{224}$

391

## Chapter 6 - Experimental

The method adopted was that of Wang ${ }^{230}$ et al. To a stirring solution of (E)-1-(3,4-dichloro phenyl)-3-(4-(methoxymethoxy)phenyl)prop-2-en-1-one 392 ( $0.100 \mathrm{~g}, 0.30 \mathrm{mmol}$ ) in methanol $\left(6 \mathrm{~cm}^{3}\right)$ under argon was added hydrochloric acid $\left(1.2 \mathrm{~cm}^{3}, 3 \mathrm{M}\right)$. The reaction was then heated to reflux at $75^{\circ} \mathrm{C}$ for 45 minutes. The reaction was cooled to room temperature and tipped into water ( $6 \mathrm{~cm}^{3}$ ), it was then extracted with dichloromethane ( $3 \times 10 \mathrm{~cm}^{3}$ ). The organic fraction was then dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Purification of the crude residue by column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 9$ to $1: 4$ ) afforded 391 as a bright yellow solid $(0.09 \mathrm{~g}, 0.30 \mathrm{mmol}, 99 \%$ ); m.p. $193-196{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.31\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3220,2924,1646$, $1591,1559,1544,1516,1444,1286,1219,1170,1051,1029,988 ; \delta^{1}{ }^{H}$ NMR ( 400 MHz ; $\left.\mathrm{CD}_{3} \mathrm{OD} ; \mathrm{ppm}\right) 6.75(2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3 \times \prime$ \& H-5’’), $7.45(1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-2), 7.55(2 \mathrm{H}$, d, $J 8.8 \mathrm{~Hz}, \mathrm{H}-2^{\prime} ’ \& H-6 ’$ ), 7.60 ( $1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-5^{\prime}$ ), 7.69 ( $1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-3$ ), 7.90 ( $1 \mathrm{H}, \mathrm{dd}, J 1.6,8.4 \mathrm{~Hz}, \mathrm{H}-6$ '), $8.10\left(1 \mathrm{H}, \mathrm{d}, J 1.6 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3}$; ppm) 116.51 ( $\mathrm{s}, \mathrm{CH}$ ), 118.42 (s, CH), 126.33 (s, C), 129.05 (s, CH), 130.91 (s, CH), 131.74 ( $\mathrm{s}, \mathrm{CH}$ ), 132.10 ( $\mathrm{s}, \mathrm{CH}$ ), 132.54 ( $\mathrm{s}, \mathrm{C}), 136.32$ ( $\mathrm{s}, \mathrm{C}), 138.77$ (s, C), 146.40 (s, CH), 161.16 (s, C), 187.39 ( $\mathrm{s}, \mathrm{CO}$ ).
(E)-1-(3,4-Dichlorophenyl)-3-(4-(methoxymethoxy)phenyl)prop-2-en-1-one 392

392
The chalcone 392 was obtained following Protocol A using 3,4-dichloroacetophenone ( 0.57 g, 3.0 mmol ), 4-(methoxymethoxy)benzaldehyde $332(0.50 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) and aqueous sodium hydroxide solution ( $3 \mathrm{~cm}^{3}, 2 \mathrm{M}$ ) in methanol ( $7 \mathrm{~cm}^{3}$ ). Recrystallization from methanol afforded 392 as yellow needles ( $0.67 \mathrm{~g}, 2.0 \mathrm{mmol}, 66 \%$ ); m.p. $109-110^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.50\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $1: 3$ ); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 1661,1594,1572,1509,1425,1211,1174,1155$, $1070,1038,981,728 ; \delta^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.50\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 5.24(2 \mathrm{H}, \mathrm{s}$, H-2'"'), 7.09 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-3$ ' $\& \mathrm{H}-5$ ' $), 7.34$ ( $1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-2$ ), 7.59 ( $1 \mathrm{H}, \mathrm{d}, J$ $8.4 \mathrm{~Hz}, \mathrm{H}-5$ '), 7.61 ( $2 \mathrm{H}, \mathrm{d}, J 8.8 \mathrm{~Hz}, \mathrm{H}-2$ '’ \& H-6’'), 7.81 ( $1 \mathrm{H}, \mathrm{d}, J 15.4 \mathrm{~Hz}, \mathrm{H}-3$ ), 7.84 ( 1 H , dd, $\left.J 2.1,8.4 \mathrm{~Hz}, \mathrm{H}-6^{\prime}\right), 8.09\left(1 \mathrm{H}, \mathrm{d}, J 2.1 \mathrm{~Hz}, \mathrm{H}-2^{\prime}\right) ; \delta{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $56.45\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 94.43\left(\mathrm{~s}, \mathrm{OCH}_{2} \mathrm{O}\right), 116.83(\mathrm{~s}, \mathrm{CH}), 119.26(\mathrm{~s}, \mathrm{CH}), 127.68(\mathrm{~s}, \mathrm{CH}), 128.47$ (s, C), 130.60 ( $\mathrm{s}, \mathrm{CH}$ ), 130.64 ( $\mathrm{s}, \mathrm{CH}$ ), 130.93 ( $\mathrm{s}, \mathrm{CH}$ ), 133.46 ( $\mathrm{s}, \mathrm{C}$ ), 137.32 ( $\mathrm{s}, \mathrm{C}$ ), 138.28 (s, C), 145.99 (s, CH), 159.83 (s, C), $188.20(\mathrm{~s}, \mathrm{CO}) ; \mathrm{m} / z\left(\mathrm{API}-\mathrm{ES}+\right.$ ) 337 ([MH] $\left.{ }^{+}, 100 \%\right), 339$

## Chapter 6 - Experimental

( $[\mathrm{MH}]^{+}, 60 \%$ ), 359 ( $[\mathrm{MNa}]^{+}, 35 \%$ ), 361 ( $[\mathrm{MNa}]^{+}, 20 \%$ ); HRMS found $[\mathrm{MH}]^{+} 337.03980$ for $\mathrm{C}_{17} \mathrm{H}_{15} \mathrm{O}_{3} \mathrm{Cl}_{2}, \mathrm{C}_{17} \mathrm{H}_{15} \mathrm{O}_{3} \mathrm{Cl}_{2}$ requires $[\mathrm{MH}]^{+} 337.03928$.

1-Acetylpyrrolidin-2-one $\mathbf{3 9 8}^{323}$

398
To a stirring solution of 2-pyrrolidinone ( $2.50 \mathrm{~cm}^{3}, 32.9 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran $\left(20 \mathrm{~cm}^{3}\right)$ at $-20^{\circ} \mathrm{C}$ under argon was slowly added a butyllithium solution in hexane (13.30 $\left.\mathrm{cm}^{3}, 2.5 \mathrm{M}\right)$. The mixture was then stirred at $-20^{\circ} \mathrm{C}$ for a further 20 minutes, and then chilled to $-78{ }^{\circ} \mathrm{C}$ before adding acetyl chloride $\left(2.56 \mathrm{~cm}^{3}, 36.0 \mathrm{mmol}\right)$ in anhydrous tetrahydrofuran $\left(30 \mathrm{~cm}^{3}\right)$. The mixture was then left stirring overnight allowing it to warm to room temperature. It was then tipped into water $\left(100 \mathrm{~cm}^{3}\right)$ and extracted with ethyl acetate $(6 \times 30$ $\mathrm{cm}^{3}$ ). The organic fraction was dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. To give a yellow oil ( $2.97 \mathrm{~g}, 23.4 \mathrm{mmol}, 71 \%$ ); $\mathrm{R}_{\mathrm{f}} 0.52\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2986,2901,1736,1687,1485,1463,1419,1359,1245$, 1228, $1191 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $1.97(2 \mathrm{H}$, quintet, $J 7.7 \mathrm{~Hz}, \mathrm{H}-4), 2.43(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{H}-2^{\prime}\right), 2.54(2 \mathrm{H}, \mathrm{t}, J 8.1 \mathrm{~Hz}, \mathrm{H}-3), 3.74(2 \mathrm{H}, \mathrm{t}, J 7.2 \mathrm{~Hz}, \mathrm{H}-5) ; \delta{ }^{13} \mathrm{C}$ NMR ( 100 MHz ; $\left.\mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 17.13\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 24.92\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 33.54\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 45.30\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 171.37(\mathrm{~s}, \mathrm{CO})$, 175.58 (s, CO).
(E)-3-((Benzo[d][1,3]dioxol-6-yl)methylene)pyrrolidin-2-one 397 ${ }^{321}$

397
The method adopted was that of Zimmer ${ }^{321}$ et al. To a stirring solution of sodium hydride $\left(4.82 \mathrm{~g}, 120.5 \mathrm{mmol}, 60 \%\right.$ dispersion in mineral oil) in anhydrous tetrahydrofuran $\left(50 \mathrm{~cm}^{3}\right)$ at $0{ }^{\circ} \mathrm{C}$ under argon, a mixture of piperonal $(5.94 \mathrm{~g}, 39.6 \mathrm{mmol})$ and 1-acetylpyrrolidin-2-one $398(5.09 \mathrm{~g}, 40.1 \mathrm{mmol})$ in anhydrous tetrahydrofuran ( $50 \mathrm{~cm}^{3}$ ) was added slowly drop wise over an hour. The reaction was then stirred at $0^{\circ} \mathrm{C}$ for a further hour. Methanol $\left(15 \mathrm{~cm}^{3}\right)$ was then added to the mixture at $0^{\circ} \mathrm{C}$ to quench any remaining sodium hydride. The mixture was then tipped into ice, acidified with Sulfuric acid (6M), and extracted with chloroform (10× $30 \mathrm{~cm}^{3}$ ). The organic fraction was dried over anhydrous magnesium sulfate, filtered and evaporated in vacuo. Recrystallization from 2-propanol afforded 397 as a cream powder

## Chapter 6 - Experimental

solid ( $2.32 \mathrm{~g}, 10.7 \mathrm{mmol}, 27 \%$ ); m.p. $246-248{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.23\left(\mathrm{SiO}_{2}\right.$, ethyl acetate); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ $3174,3051,2898,1678,1639,1601,1495,1444,1266,1240,1038,810 ; \delta{ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 3.12(2 \mathrm{H}, \mathrm{td}, J 6.5,2.8 \mathrm{~Hz}, \mathrm{H}-4), 3.56(2 \mathrm{H}, \mathrm{t}, J 6.5 \mathrm{~Hz}, \mathrm{H}-5), 6.01(2 \mathrm{H}, \mathrm{s}$, H-2''), 6.45 ( 1 H, br. ## (E)-3-((Benzo[d][1,3]dioxol-5-yl)methylene)-2-oxopyrrolidine-1-carbaldehyde 396

396

The method adopted was that of Rigo ${ }^{322}$ et al. A mixture of $(E)$-3-((benzo[d][1,3]dioxol-6yl)methylene) pyrrolidin-2-one $397\left(1.64 \mathrm{~g}, 7.6 \mathrm{mmol}\right.$ ) in neat formic acid ( $27 \mathrm{~cm}^{3}$ ) was heated to reflux at $105^{\circ} \mathrm{C}$ for 18 hours. The mixture was then cooled to room temperature and evaporated in vacuo. Purification of the crude residue by column chromatography $\left(\mathrm{SiO}_{2}\right.$, ethyl acetate: $\mathrm{CHCl}_{3} 1: 4$ ) afforded 396 as a white solid ( $1.02 \mathrm{~g}, 4.2 \mathrm{mmol}, 55 \%$ ); m.p. 197 $198{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.56\left(\mathrm{SiO}_{2}\right.$, ethyl acetate: $\left.\mathrm{CHCl}_{3} 1: 4\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 2915,1724,1684,1634,1600$, $1505,1493,1451,1440,1342,1310,1229,1039,718 ; \delta{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}$ ) $3.09(2 \mathrm{H}, \mathrm{dt}, J 2.8 \mathrm{~Hz} J 7.3 \mathrm{~Hz}, \mathrm{H}-4), 3.82(2 \mathrm{H}, \mathrm{t}, J 7.3 \mathrm{~Hz}, \mathrm{H}-5), 6.03$ ( $\left.2 \mathrm{H}, \mathrm{s}, \mathrm{H}-\mathbf{2}^{\prime}{ }^{\prime}\right), 6.88$ ( $1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}, \mathrm{H}-4{ }^{\prime}$ ), $7.00\left(1 \mathrm{H}, \mathrm{d}, J 1.6 \mathrm{~Hz}, \mathrm{H}-7^{\prime}\right)$ ), $7.06\left(1 \mathrm{H}, \mathrm{dd}, J 1.6,8.0 \mathrm{~Hz}, \mathrm{H}-5^{\prime \prime}\right)$, $7.53\left(1 \mathrm{H}, \mathrm{t}, J 2.8 \mathrm{~Hz}, \mathrm{H}-1{ }^{\prime}\right), 9.24\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1{ }^{\prime}{ }^{\prime \prime}\right) ; \delta^{13} \mathrm{C}$ NMR ( $\left.100 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{ppm}\right) 23.78$ (s, $\underline{\mathrm{C}}_{\mathrm{CH} 2} \mathrm{NH}$ ), 39.59 ( $\mathrm{s}, \mathrm{CH}_{\mathrm{CH} 2} \mathrm{NH}$ ), 101.78 (s, $\mathrm{OCH}_{2} \mathrm{O}$ ), 108.93 ( $\mathrm{s}, \mathrm{CH}$ ), 109.36 (s, CH), 126.22 (s, C), 126.67 (s, CH), 128.94 ( $\mathrm{s}, \mathrm{C}$ ), 136.06 ( $\mathrm{s}, \mathrm{CH}$ ), 148.34 ( $\mathrm{s}, \mathrm{C}), 149.31$ (s, C), $161.21(\mathrm{~s}, \mathrm{CHO}), 170.17(\mathrm{~s}, \mathrm{CO}) ; \mathrm{m} / z(\mathrm{AP}+) 246\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+}$ 246.0758 for $\mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{4} \mathrm{~N}, \mathrm{C}_{13} \mathrm{H}_{12} \mathrm{O}_{4} \mathrm{~N}$ requires [MH] ${ }^{+}$246.0761.

## Protocol H

The method adopted was that of Zimmer ${ }^{321}$ et al. To a stirring solution of sodium hydride ( $0.36 \mathrm{~g}, 9.0 \mathrm{mmol}, 60 \%$ dispersion in mineral oil) in anhydrous tetrahydrofuran $\left(5 \mathrm{~cm}^{3}\right)$ at 0 ${ }^{\circ} \mathrm{C}$ under argon, a mixture of benzaldehyde and rhodanine in anhydrous tetrahydrofuran was added slowly drop wise over 20 minutes. The reaction was then stirred at $0^{\circ} \mathrm{C}$ for a further hour. Methanol ( $3 \mathrm{~cm}^{3}$ ) was then added to the mixture at $0^{\circ} \mathrm{C}$ to quench any remaining

## Chapter 6 - Experimental

sodium hydride. The mixture was then tipped into ice, acidified with Sulfuric acid ( $10 \mathrm{~cm}^{3}$, $1 \mathrm{M})$. The precipitate was then filtered off and recrystallized from acetone.
(Z)-5-((Benzo[d][1,3]dioxol-6-yl)methylene)-2-thioxothiazolidin-4-one 402 ${ }^{358}$

402
The KNK analogue 402 was obtained following Protocol H using piperonal ( $0.45 \mathrm{~g}, 3.0$ $\mathrm{mmol})$ and rhodanine $(0.40 \mathrm{~g}, 3.0 \mathrm{mmol})$ in anhydrous tetrahydrofuran $\left(5 \mathrm{~cm}^{3}\right)$. Recrystallization from acetone afforded 402 as a yellow powder ( $0.52 \mathrm{~g}, 1.95 \mathrm{mmol}, 65 \%$ ); m.p. 292-293 ${ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.10\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:1); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3158$ (broad m), 3051 (m), 2913 (m), 2833, 1691, 1582, 1501, 1431, 1371, 1264, 1223, 1035, 920, 803, 665; $\delta{ }^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) 6.13 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{H}-\mathbf{2}^{\prime ’)}$ ), 7.08 ( $1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}, \mathrm{H}-4^{\prime}$ ), 7.11 ( $1 \mathrm{H}, \mathrm{d}, J 1.9 \mathrm{~Hz}, \mathrm{H}-7^{\prime}{ }^{\prime}$ ), $7.15\left(1 \mathrm{H}, \mathrm{dd}, J 1.9 \mathrm{~Hz}, J 8.0 \mathrm{~Hz}, \mathrm{H}-5^{\prime}{ }^{\prime}\right), 7.56(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1$ '), 13.81 ( 1 H, br. s, NH-3); $\delta^{13} \mathrm{C}\left(100 \mathrm{MHz} ;\right.$ d6-DMSO; ppm) $102.84\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 110.01$ (s, CH), 110.19 (s, CH), 123.57 (s, C), 127.39 (s, CH), 127.84 (s, C), 132.60 (s, CH), 149.00 (s, C), 150.36 (s, C), 170.05 ( $\mathrm{s}, \mathrm{CO}$ ), 196.04 ( $\mathrm{s}, \mathrm{CS}$ ).
(Z)-5-(2,4-Dichlorobenzylidene)-2-thioxothiazolidin-4-one 403 ${ }^{359}$

403
The KNK analogue 403 was obtained following Protocol H using 2,4-dichlorobenzaldehyde $(0.53 \mathrm{~g}, 3.0 \mathrm{mmol})$ and rhodanine $(0.40 \mathrm{~g}, 3.0 \mathrm{mmol})$ in anhydrous tetrahydrofuran $\left(5 \mathrm{~cm}^{3}\right)$. Recrystallization from acetone afforded 403 as a light orange solid ( $0.38 \mathrm{~g}, 1.3 \mathrm{mmol}, 44 \%$ ); m.p. $230-231^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.37\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3100,2924,2847$, $1734,1592,1578,1467,1444,1412,1234,1153,1108,803,773,734,684,669 ; \delta{ }^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) 7.51 ( $1 \mathrm{H}, \mathrm{d}, J 8.7 \mathrm{~Hz}, \mathrm{H}-6^{\prime}{ }^{\prime}$ ), $7.58(1 \mathrm{H}, \mathrm{dd}, J 1.9,8.7 \mathrm{~Hz}, \mathrm{H}-$ $\left.5^{\prime \prime}\right), 7.64\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1^{\prime}\right), 7.82\left(1 \mathrm{H}, \mathrm{d}, J 1.9 \mathrm{~Hz}, \mathrm{H}-3^{\prime \prime}\right) ; \delta^{13} \mathrm{C}$ (100MHz; d6-DMSO; ppm) 125.38 (s, CH), 129.17 (s, CH), 130.53 (s, C), 130.60 (s, C), 130.70 (s, CH), 131.08 (s, CH), 136.30 ( $\mathrm{s}, \mathrm{C}$ ), 136.38 ( $\mathrm{s}, \mathrm{C}$ ), 169.99 (s, CO), 196.04 (s, CS).

## Chapter 6 - Experimental

## (Z)-5-(5-Bromo-2-methoxybenzylidene)-2-thioxothiazolidin-4-one 404

The KNK analogue 404 was obtained following Protocol H using 5-bromo-2methoxybenzaldehyde ( $0.64 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) and rhodanine ( $0.40 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $5 \mathrm{~cm}^{3}$ ). Recrystallization from acetone afforded 404 as orange flakes ( 0.51 $\mathrm{g}, 1.6 \mathrm{mmol}, 52 \%) ;$ m.p. $262-263^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.22\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\text {max. }}\left(\mathrm{cm}^{-1}\right)$ 3140, 3029, 2857, 1694, 1577, 1478, 1454, 1253, 1229, 1186, 815; $\delta^{1}{ }^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) $3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.13(1 \mathrm{H}, \mathrm{d}, J 8.4 \mathrm{~Hz}, \mathrm{H}-3$ ''), $7.48(1 \mathrm{H}, \mathrm{d}, J 2.5 \mathrm{~Hz}, \mathrm{H}-$ $6^{\prime \prime}$ ), $7.62-7.68\left(2 \mathrm{H}, \mathrm{m}, \mathrm{H}-4^{\prime \prime} \& \mathrm{H}-1^{\prime}\right) 13.85(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH}-3) ; \delta^{13} \mathrm{C}(100 \mathrm{MHz} ; \mathrm{d} 6-\mathrm{DMSO} ;$ ppm) $56.82\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 113.5(\mathrm{~s}, \mathrm{C}), 114.99(\mathrm{~s}, \mathrm{CH}), 124.35(\mathrm{~s}, \mathrm{C}), 125.77(\mathrm{~s}, \mathrm{CH}), 128.15(\mathrm{~s}$, C), 132.37 (s, CH), 135.55 ( $\mathrm{s}, \mathrm{CH}$ ), 157.76 ( $\mathrm{s}, \mathrm{C}), 170.24$ ( $\mathrm{s}, \mathrm{CO}$ ), 196.52 (s, CS); m/z(APIES+) $330\left(\mathrm{MH}^{+}, 100 \%\right), 332\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 329.92554$ for $\mathrm{C}_{11} \mathrm{H}_{9} \mathrm{BrNO}_{2} \mathrm{~S}_{2}, \mathrm{C}_{11} \mathrm{H}_{9} \mathrm{BrNO}_{2} \mathrm{~S}_{2}$ requires [MH] ${ }^{+}$329.92526.
(Z)-5-(4-Methoxybenzylidene)-2-thioxothiazolidin-4-one 405 ${ }^{324,360}$

405
The KNK analogue 405 was obtained following Protocol H using $p$-anisaldehyde $\left(0.34 \mathrm{~cm}^{3}\right.$, 3.0 mmol ) and rhodanine ( $0.40 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $5 \mathrm{~cm}^{3}$ ). Recrystallization from acetone afforded 405 as light orange crystals ( $0.50 \mathrm{~g}, 2.0 \mathrm{mmol}, 66 \%$ ); m.p. $254-255{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.22\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }} .\left(\mathrm{cm}^{-1}\right) 3127,2923,2851$, 1683, 1582, 1563, 1507, 1443, 1421, 1258, 1237, 1197, 1168, 821; $\delta^{\prime}{ }^{\prime} H$ NMR ( 400 MHz ; d6-DMSO; ppm) $3.83\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 7.11\left(2 \mathrm{H}, \mathrm{d}, J 9.0 \mathrm{~Hz}, \mathrm{H}-3^{\prime \prime}\right.$ \& H-5''), 7.56 (2H, d, J $9.0 \mathrm{~Hz}, \mathrm{H}-2^{\prime}$ ' \& H-6''), $7.61\left(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1^{\prime}\right), 13.75(1 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{NH}-3) ; \delta^{13} \mathrm{C}(100 \mathrm{MHz} ; \mathrm{d} 6-$ DMSO; ppm) 56.25 ( $\mathrm{s}, \mathrm{CH}_{3}$ ), 115.78 ( $\mathrm{s}, \mathrm{CH}$ ), 122.97 ( $\mathrm{s}, \mathrm{C}$ ), 126.17 ( $\left.\mathrm{s}, \mathrm{C}\right), 132.52$ ( $\mathrm{s}, \mathrm{CH}$ ), 133.37 (s, CH), 162.01 (s, C), 170.21 (s, CO), 196.24 (s, CS).

## Chapter 6 - Experimental

(Z)-5-(3,5-Dimethoxybenzylidene)-2-thioxothiazolidin-4-one 406

406
The KNK analogue 406 was obtained following Protocol H using 3,5-dimethoxybenzaldehde $(0.50 \mathrm{~g}, 3.0 \mathrm{mmol})$ and rhodanine $(0.40 \mathrm{~g}, 3.0 \mathrm{mmol})$ in anhydrous tetrahydrofuran $\left(5 \mathrm{~cm}^{3}\right)$. Recrystallization from acetone afforded 406 as a orange solid ( $0.53 \mathrm{~g}, 1.9 \mathrm{mmol}, 63 \%$ ); m.p. $257-259^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.22\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\max }\left(\mathrm{cm}^{-1}\right) 3190,3140,3065,2833$, $1712,1597,1482,1439,1204,1156,981,740 ; \delta^{1}{ }^{1}$ NMR ( 400 MHz ; d6-DMSO; ppm) 3.79 ( $6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ), 6.63 ( $1 \mathrm{H}, \mathrm{t}, J 2.1 \mathrm{~Hz} \mathrm{H}-4$ ''), 6.71 ( $2 \mathrm{H}, \mathrm{d}, J 2.1 \mathrm{~Hz}, \mathrm{H}-2$ '’ \& H-6' $), 7.55$ ( 1 H , $\left.\mathrm{s}, \mathrm{H}-1^{\prime}\right), 13.82(1 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{NH}-3) ; \delta^{13} \mathrm{C}(100 \mathrm{MHz} ; \mathrm{d} 6-\mathrm{DMSO} ; \mathrm{ppm}) 56.15\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 103.48$ (s, CH ), 108.74 ( $\mathrm{s}, \mathrm{CH}$ ), 126.95 (s, C), 132.17 (s, CH), 135.52 (s, C), 161.56 (s, C), 170.16 (s, CO ), 196.36 ( $\mathrm{s}, \mathrm{CS}$ ); $m / z\left(\mathrm{API}-\mathrm{ES}+\right.$ ) $282\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 282.02487$ for $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{NO}_{3} \mathrm{~S}_{2}, \mathrm{C}_{12} \mathrm{H}_{12} \mathrm{NO}_{3} \mathrm{~S}_{2}$ requires [MH] ${ }^{+}$282.02531.
(Z)-5-(3,4,5-Trimethoxybenzylidene)-2-thioxothiazolidin-4-one 407 ${ }^{361}$

The KNK analogue 407 was obtained following Protocol H using 3,4,5trimethoxybenzaldehde ( $0.59 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) and rhodanine ( $0.40 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $5 \mathrm{~cm}^{3}$ ). Recrystallization from acetone afforded 407 as orange crystals ( 0.37 $\mathrm{g}, 1.2 \mathrm{mmol}, 40 \%) ;$ m.p. $192-194{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.15\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane $\left.1: 3\right) ; v_{\max }\left(\mathrm{cm}^{-1}\right)$ 3140, 2923, 2853, 1687, 1595, 1571, 1498, 1454, 1416, 1299, 1216, 1128, 1067, 991, 823; $\delta$ ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) $3.71\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.82\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.88(2 \mathrm{H}, \mathrm{s}$, H-2" \& H-6’'), 7.57 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1$ '), 13.80 ( 1 H , br. s, NH-3); $\delta^{13} \mathrm{C}$ (100MHz; d6-DMSO; ppm) $56.71\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 60.91\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 108.62(\mathrm{~s}, \mathrm{CH}), 125.04(\mathrm{~s}, \mathrm{C}), 129.13(\mathrm{~s}, \mathrm{C}), 132.69(\mathrm{~s}$, CH), 140.41 (s, C), 153.94 (s, C), 170.03 (s, CO), 196.19 (s, CS).

## Chapter 6 - Experimental

(Z)-5-(2,4,6-Trimethoxybenzylidene)-2-thioxothiazolidin-4-one 408

The KNK analogue 408 was obtained following Protocol $H$ using 2,4,6trimethoxybenzaldehde ( $0.59 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) and rhodanine ( $0.40 \mathrm{~g}, 3.0 \mathrm{mmol}$ ) in anhydrous tetrahydrofuran ( $10 \mathrm{~cm}^{3}$ ). Recrystallization from acetone afforded 408 as a light orange/brown solid ( $0.76 \mathrm{~g}, 2.4 \mathrm{mmol}, 81 \%$ ); m.p. $260-262{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}} 0.12\left(\mathrm{SiO}_{2}\right.$, ethyl acetate:hexane 1:3); $v_{\text {max. }}\left(\mathrm{cm}^{-1}\right) 3055,2977,2935,2852,1704,1682,1607,1561,1461$, 1440, 1202, 1179, 1157, 1121; $\delta^{1} \mathrm{H}$ NMR ( 400 MHz ; d6-DMSO; ppm) $3.84\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.86\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 6.29\left(2 \mathrm{H}, \mathrm{s}, \mathrm{H}-3^{\prime \prime}\right.$ \& H-5''), 7.79 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-1$ '), 13.37 ( $1 \mathrm{H}, \mathrm{br} . \mathrm{s}, \mathrm{NH}-3$ ); $\delta^{13} \mathrm{C}(100 \mathrm{MHz} ; \mathrm{d} 6-\mathrm{DMSO} ; \mathrm{ppm}) 56.51\left(\mathrm{~s}, \mathrm{CH}_{3}\right), 91.77(\mathrm{~s}, \mathrm{CH}), 104.4(\mathrm{~s}, \mathrm{C}), 123.02(\mathrm{~s}, \mathrm{C})$, 126.47 (s, CH), 160.67 ( $\mathrm{s}, \mathrm{C}$ ), 165.65 ( $\mathrm{s}, \mathrm{C}$ ), 170.61 ( $\mathrm{s}, \mathrm{CO}$ ), 197.92 (s, CS); m/z(API-ES+) $312\left(\mathrm{MH}^{+}, 100 \%\right)$; HRMS found $[\mathrm{MH}]^{+} 312.03590$ for $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{NO}_{4} \mathrm{~S}_{2}, \mathrm{C}_{13} \mathrm{H}_{14} \mathrm{NO}_{4} \mathrm{~S}_{2}$ requires $\left[^{(M H}\right]^{+} 312.03588$.
