Abstract: A new series of compounds characterized by the presence of a 2-methoxy/ethoxycarbonyl group, combined with either no substituent or a methoxy group at each of the four possible positions of the benzene portion of the 3-(3’,4’,5’-trimethoxyanilino)benzo[b]furan skeleton, were evaluated for antiproliferative activity against cancer cells in culture, and, for selected, highly active compounds, inhibition of tubulin polymerization, cell cycle effects and in vivo potency. The greatest antiproliferative activity occurred with a methoxy group introduced at the C-6 position, the least with this substituent at C-4. Thus far, the most promising compound in this series was 2-methoxycarbonyl-3-(3’,4’,5’-trimethoxyanilino)-6-methoxybenzo[b]furan (3g), which inhibited cancer cell growth at nanomolar concentrations (IC₅₀’s, 0.3-27 nM), bound to the colchicine site of tubulin, induced apoptosis and showed, both in vitro and in vivo, potent vascular disrupting properties derived from the effect of this compound on vascular endothelial cells. Compound 3g had in vivo antitumor activity in a murine model comparable to the activity obtained with combretastatin A-4 phosphate.
Introduction

Microtubules, dynamic cellular structures in neoplastic and non-neoplastic cells, are generated by the polymerization of α,β-tubulin heterodimers.\textsuperscript{1,2} Besides being critical for cell architecture, the microtubule system is essential for cell division, being the major component of the mitotic spindle, and for fundamental cellular processes, such as regulation of motility, cell signaling, secretion and intracellular transport.\textsuperscript{3-5} A significant number of antimitotic agents, many of which are natural products, interact specifically with tubulin and are able to affect tubulin polymerization.\textsuperscript{6-8} More recent studies have demonstrated that several small molecules able to interfere with the dynamic assembly of tubulin in generating the microtubule system are also able to induce extensive morphological changes in the endothelial cells of tumor vasculature. Such agents can thus also be classified as vascular disrupting agents (VDA).\textsuperscript{9-12} The \textit{cis}-stilbene natural product combretastatin A-4 (CA-4, 1, Chart 1), isolated by Pettit et al. from the bark of the South African bush willow tree \textit{Combretum caffrum},\textsuperscript{13} strongly inhibits tubulin polymerization through binding to the colchicine site of tubulin.\textsuperscript{14} CA-4 shows strong growth inhibition against a variety of cancer cells, including multidrug resistant cancer cell lines.\textsuperscript{15} A water-soluble disodium phosphate ester derivative of 1\textit{a} (named CA-4P, 1\textit{b}) has shown promising results in clinical trials.\textsuperscript{16} CA-4P is under evaluation in phase III trials for the treatment of anaplastic thyroid cancer and in phase II trials for non-small cell lung cancer and platinum-resistant ovarian cancer.\textsuperscript{17,18} Previous studies have yielded series of chemically diverse small molecules based on the benzo[\textit{b}]furan scaffold, and the most active of these compounds act as antimitotic agents.\textsuperscript{19-21} The 3-(3’,4’,5’-trimethoxybenzoyl)-6-methoxybenzo[\textit{b}]furan molecular skeleton was the core structure of a series of antitubulin agents with general structure 2 identified by Pinney and co-workers as potent inhibitors of both tubulin polymerization and cell proliferation of the MCF-
7 and MDA-MB-231 cancer cell lines.\textsuperscript{22-24} While at the C-2 position there was a wide tolerance to structural variation with hydrophobic and hydrophilic substituents, at the C-3 position the carbon linker with the 3’,4’,5’-trimethoxyphenyl substituent was more effective as a carbonyl group than as a carbinol or a simple methylene group.\textsuperscript{22} Previous studies have shown that the concomitant presence of a C-6 methoxy substituent significantly contributed to maximal activity, presumably as a mimic of the 4-methoxy group in the B-ring of CA-4.\textsuperscript{23} The introduction of a hydroxyl at the C-7 position was well tolerated and afforded compounds with similar potency for R\textsubscript{2}=H, while a 10-fold increase in activity was observed for R\textsubscript{2}=OH. Among the synthesized compounds, the C-2 methoxycarbonyl analogue 2a showed potent activity in inhibiting the growth of the MDA-MB-231 human breast cancer cell line (IC\textsubscript{50}: 1-10 nM). Moreover, 2a had no significant selectivity against activated over quiescent human umbilical vein endothelial cells (HUVECs) (IC\textsubscript{50}: 1-10 nM).\textsuperscript{25} These findings prompted us to analyze this class of compounds in more detail. Specifically, we were intrigued by the idea of studying the biological effects of replacing the carbonyl group at the C-3 position of compound 2a by an anilinic nitrogen (NH) moiety with hydrogen-bond accepting and donating capability, to furnish a new series of 2-methoxy/ethoxycarbonyl-3-(3’,4’,5’-trimethoxyanilino)benzo[b]furan derivatives with general structure 3. By the synthesis of this series of compounds, we focused on the effects on antiproliferative activity obtained by the insertion of an electron-donating methoxy substituent at the C-4, C-5, C-6 or C-7 positions, combined with the methoxy/ethoxycarbonyl substitution at the C-2 position of the benzo[b]furan nucleus. In this new class of compounds, the anilinic hydrogen at the C-3 position was also potentially able to generate an internal hydrogen bond with the sp\textsubscript{2}-oxygen of the alkoxy carbonyl moiety.
Chemistry

Compounds 3a-l were synthesized by a two-step procedure described in Scheme 1. The condensation of 2-hydroxy benzonitrile derivatives 4a-f with methyl or ethylbromoacetate and K$_2$CO$_3$ in DMF furnished by a tandem “one-pot” cyclization procedure the 2-methoxy/ethoxycarbonyl-3-amino benzo[b]furan derivatives 5a-l in good yields. Finally, the novel derivatives 3a-l were prepared using the C-N Buchwald-Hartwig palladium catalyzed cross-coupling protocol, by reaction of deactivated 3-amino benzo[b]furan analogues 5a-l with 1-bromo-3,4,5-trimethoxybenzene, in the presence of Pd(OAc)$_2$, rac-BINAP and Cs$_2$CO$_3$ (as catalyst, ligand and base, respectively) in toluene at 100 °C.

Biological Results and Discussion

**In vitro antiproliferative activities.** In Table 1 are summarized the in vitro antiproliferative activities of 2-methoxy/ethoxycarbonyl-3-(3’,4’,5’-trimethoxyanilino)benzo[b]furan derivatives 3a-l against a panel of seven human cancer cell lines, using 1a as reference compound. The results presented in Table 1 indicate that inhibition of cell growth was highly dependent upon the presence and position of the methoxy substituent on the benzene portion of the benzo[b]furan system. In both series of 2-alkoxycabonyl derivatives, the greatest activity occurred when the methoxy group was located at the C-6 position (3g and 3h), the least when it was located at the C-4 (IC$_{50}$>10 μM) position. In fact, the IC50’s obtained in the 7 cell lines with the C-6 substituted compounds ranged from 0.3 to 27 (average, 7.8) nM with 3g and from 13 to 100 (average, 34) nM with 3h. The superiority of the methoxycarbonyl substituent over the ethoxycarbonyl substituent was observed in all of the cell lines except the MCF-7 cells, which were equally sensitive to both compounds. Overall, compounds 3i (average IC$_{50}$, 370 nM) and 3j (average IC$_{50}$, 670 nM), with the C-7 methoxy substituent,
were more active than 3e (average IC$_{50}$, 1,500 nM) and 3f (average IC$_{50}$, 2,900 nM), with the C-5 methoxy substituent. For these latter two pairs of compounds, an occasional cell line was highly sensitive: RS 4;11 cells had IC$_{50}$ values of 39 nM with 3e and 1 nM with 3i, and Jurkat cells had an IC$_{50}$ value of 30 nM with 3i. Average IC$_{50}$ values for the compounds bearing no methoxy substituent were 3,300 and 2,600 nM for compounds 3a and 3b, respectively. Thus, even the C-5 methoxy substituent improved overall compound activity. Finally, we also prepared both the methoxy- and ethoxycarbonyl compounds with a C-7 ethoxy substituent (3k and 3l, respectively). With all cell lines, the C-7-ethoxy compound was significantly less active than its cognate C-7-methoxy compound.

The most potent compound identified in this study was the 2-methoxycarbonyl-3-(3’,4’,5’-trimethoxyanilino)-6-methoxybenzo[b]furan derivative 3g, which was more active than the reference compound CA-4 in five of the seven cancer cell lines, while the two compounds had similar activity against Jurkat and HL-60 cells. The antiproliferative data obtained with 3g may indicate that an anilinic nitrogen with a hydrogen as a proton bonding donor at the C-3 position of the benzo[b]furan skeleton can be a good surrogate for the carbonyl group in compounds with general structure 2.

In comparing the two series of 2-alkoxycarbonyl derivatives with the methoxy group at the same position of the benzo[b]furan nucleus, the 2-methoxycarbonyl derivative generally had greater activity than its ethoxycarbonyl counterpart (i.e., 3e vs. 3f, 3g vs. 3h, 3i vs. 3j, 3k vs. 3l).

**Evaluation of antiproliferative activity in non-cancer cells.** We investigated the effects of the two most active compounds (3g and 3h) on non-cancer cells. We examined human peripheral blood lymphocytes (PBLs) and HUVECs isolated from healthy donors. As shown in Table 2, in both unstimulated and mitogen-activated lymphocytes, the two compounds had
little toxicity as compared to tumor cells. Somewhat greater toxicity was noted in HUVECs incubated with the two compounds, although also in this case the IC$_{50}$ values were substantially higher than those obtained with the tumor cells. Moreover, in contrast to what was found with the tumor cells, 3h was more active than 3g in the non-cancer cells. These results suggest that 3g and 3h may have a preferential selectivity toward cancer cells.

**Inhibition of tubulin polymerization and colchicine binding.** Compounds 3e and 3g-j and the reference compound CA-4 were evaluated for inhibitory effects on tubulin polymerization and on the binding of [³H]colchicine to tubulin for an indication whether their antiproliferative effects might be caused by an interaction with microtubules (Table 3). The most potent of the compounds examined was 3g, with an assembly IC$_{50}$ of 1.1 μM, the same value obtained with CA-4, while 3h was slightly less active than CA-4. This is in agreement with 3g being the compound with the greatest antiproliferative activity. Compounds 3e, 3i and 3j were 6-7-fold less active than CA-4, with IC$_{50}$ values of 7.5, 7.6 and 6.4 μM, respectively, which was consistent with their lower antiproliferative activity. Colchicine binding studies were performed on the only derivatives (3g and 3h) with tubulin assembly IC$_{50}$ values lower than 5 μM. In reaction mixtures containing 1.0 μM tubulin and 5.0 μM [³H]colchicine, compound 3g potently inhibited the binding to [³H]colchicine to tubulin, with 83% inhibition occurring when 3g and radiolabeled drug were at 5.0 μM in the reaction mixture. Compound 3g was less potent than 1a, which in these experiments inhibited colchicine binding by 99%. Derivative 3h was slightly less potent than 3g, with 74% inhibition occurring with the compound at 5.0 μM.

For the most active compounds 3g and 3h, a good correlation was observed between antiproliferative activities and inhibition of tubulin polymerization and colchicine binding.
These results suggest that these two derivatives act as microtubule-depolymerizing agents through an interaction with tubulin at the colchicine site or a site that overlaps the colchicine site.

**Molecular modeling.** In order to investigate the possible binding mode of these novel compounds, a series of molecular docking studies were performed in the colchicine site of tubulin. In the binding mode for compound 3g presented in Figure 1, the trimethoxyphenyl ring of the compound is in proximity to Cys241. Furthermore, there is a potential hydrogen bond between the ester moiety and Ala250, an interaction observed with other colchicine site agents. These results could provide an explanation for the difference in biological activity observed for the compounds bearing a substituent in position 4, 5 or 7 of the benzo[b]furan (e.g. 3c, 3e and 3i) versus 3g with its 6-methoxy group. Our models indicate that the colchicine-binding pocket cannot readily accommodate the compounds with the 4-, 5- or 7-methoxy substituents.

**Analysis of cell cycle effects.** The effects of a 24 h treatment with different concentrations of 3g or 3h on cell cycle progression was determined by flow cytometry in Jurkat and HeLa cells (Figure 2, Panels A and B). The two compounds caused a significant G2/M arrest in a concentration-dependent manner in the cell lines tested, with a rise in G2/M cells occurring at a concentration as low as 60 nM, while at higher concentrations more than 70% of the cells were arrested in G2/M. The cell cycle arrest in G2/M phase was accompanied by a comparable reduction in the proportion of cells in both the G1 and S phases of the cell cycle. We next studied the association between the induced G2/M arrest by the two compounds and alterations in expression of various proteins that regulate cell division. As shown in Figure 2 (Panel C) in HeLa cells, a 24 h treatment with either compound at 100 nM or 250 nM caused a significant increase in cyclin B expression, which, in association with cdc2, controls both
entry into and exit from mitosis.\textsuperscript{30,31} After a 48 h treatment, cyclin B expression decreased. More importantly, p-cdc2\textsuperscript{Tyr15} expression increased after a 24 h treatment, while at 48 h a slight decrease was observed. However, no major changes in the expression of phosphatase cdc25c were observed. These results indicate that arrest at G2/M induced by the compounds is caused by an increase of cyclin B activity, followed by its accumulation, leading to a decrease of p-cdc2\textsuperscript{Tyr15}. The decline in the level of p-cdc2\textsuperscript{Tyr15} at 48 h was more marked at the highest concentration (250 nM) examined.

**Compounds 3g and 3h induce apoptosis through the mitochondrial pathway.** The mode of cell death induced by 3g and 3h was investigated with the annexin-V assay.\textsuperscript{32} As depicted in Figure 3 (Panels A and B), HeLa cells treated with 3g or 3h for 24 or 48 h showed an accumulation of annexin-V positive cells in comparison with the control, in a concentration and time-dependent manner, and this is indicative of the occurrence of apoptosis. Since many antimitotic compounds induce apoptosis through the mitochondrial pathway,\textsuperscript{33-36} we determined whether 3g and 3h induced an alteration of the mitochondrial transmembrane potential (\(\Delta\Psi_{\text{mt}}\)). \(\Delta\Psi_{\text{mt}}\) was monitored by flow cytometry using the dye 5,5',6,6'-tetrachloro-1,1',3,3'-tetraethylbenzimidazolcarbocyanine (JC-1). As shown in Figure 4 (Panel A) in HeLa cells, both 3g and 3h induced a time and concentration-dependent increase in the proportion of cells with depolarized mitochondria.

Mitochondrial membrane depolarization is associated with mitochondrial production of reactive oxygen species (ROS).\textsuperscript{37} Therefore, we investigated whether ROS production increased after treatment with the test compounds. We measured the production of ROS by flow cytometry utilizing 2,7-dichlorodihydrofluorescein diacetate (H\textsubscript{2}-DCFDA).

As shown in Figure 4 (Panel B), both 3g and 3h induced the production of significant amounts of ROS in comparison with control cells, in agreement with the dissipation of \(\Delta\Psi_{\text{mt}}\).
Altogether, these results indicate that these compounds induced apoptosis through the mitochondrial pathway.

**Compounds 3g and 3h induce activation of caspases and down-regulation of the anti-apoptotic proteins Bcl-2 and Mcl-1.** To determine whether compounds 3g and 3h induced caspase-dependent cell death, we performed an immunoblot analysis of the activation of caspase-9 and caspase-3, two caspases involved in the apoptotic mitochondrial pathway. Exposure of HeLa cells to either compound resulted in the activation of caspase-9 and caspase-3 in a time and concentration dependent manner, as shown in Figure 5. Moreover, we also observed the cleavage of poly(ADP-ribose) polymerase (PARP), which is one of the main cleavage targets of caspase-3, both *in vitro* and *in vivo*.\(^{38}\)

Many recent studies have shown that regulation of the Bcl-2 family of proteins shares the signaling pathways induced by antimicrotubule compounds.\(^{33,34}\) Several pro-apoptotic family proteins (e.g., Bax, Bid, Bim and Bak) promote the release of cytochrome c, whereas anti-apoptotic members (Bcl-2, Bcl-XL and Mcl-1) are capable of antagonizing the pro-apoptotic proteins and preventing the loss of mitochondrial membrane potential. In agreement with these observations, we found that Bcl-2 after a 48 h treatment with either compound was reduced, while the expression of Mcl-1, which is another anti-apoptotic member of the Bcl-2 family, was also strongly down regulated. This change was observed after 48 h treatments at both 100 and 250 nM. However, at 24 h we observed an increase in the expression of Mcl-1 with 3g but not with 3h.

Altogether, our findings indicate that 3g and 3h are able to down regulate the expression of antiapoptotic proteins in line with recent reports that suggest that sensitivity to antimitotic drugs is regulated by Mcl-1 levels.\(^{39}\)
Evaluation of antitumor activity of compound 3g in vivo. To determine the in vivo antitumor activity of 3g, a syngeneic hepatocellular carcinoma model in mice was used. In preliminary experiments in vitro, we had determined that both compound 3g and CA-4, used as reference compound, showed potent cytotoxic activity (3g, IC_{50}=1.2±0.6 nM; CA-4, IC_{50}=0.9±0.5 nM) against BNL 1ME A.7R.1 cells. Tumors were established by subcutaneous injection of BNL 1ME A.7R.1 cells into the backs of Balb/c mice. Once the tumor reached a measurable size (about 100 mm^3), twenty mice were randomly assigned to one of four groups. In two of the groups, compound 3g was injected intraperitoneally at doses of 5 and 10 mg/kg, respectively. In a third group, CA-4P was injected at 5 mg/kg, while the fourth group was used as a control. As shown in Figure 6 (Panel A), compound 3g caused a significant reduction in tumor growth (44.5%), as compared with administration of vehicle, at the dose of 10 mg/kg but not at 5 mg/kg. At the lower dose the growth inhibition shown in the figure did not reach statistical significance. The effect of 5 mg/kg of CA-4P was not substantially different from that of 10 mg/kg of 3g, and the CA-4P effect was significant relative to the control. During the treatment period, only a small decrease in body weight occurred in the animals treated with 3g at the higher concentration (Figure 6, Panel B).

Derivative 3g has antivascular effects in vitro and in vivo. Recent antitumor strategies have included the use of chemotherapeutics with antiangiogenic or antivascular drugs to increase the efficacy of the treatment. Many tubulin binding agents show antivascular effects against tumor endothelium, including CA-4, and for that reason we evaluated 3g for its effects on endothelial cells in vitro. We used HUVECs as a model to study angiogenesis in vitro. Endothelial cell migration to the tumor site is an important mechanism of angiogenesis, and the inhibition of this process is a valuable strategy to arrest the development of tumor vasculature. With this aim, we evaluated endothelial cell motility by scratching a HUVEC
monolayer and monitoring the ability of cells to reclose the wound. As shown in Figure 7 (Panels A and B), 3g was very efficient in arresting cell motility. The effect was statistically significant with only a 6 h incubation at 25 nM and became highly significant for all the tested concentrations after 24 h, even with only 5 nM 3g.

To further evaluate the antivasclualr activity of 3g, we analyzed the ability of the compound to disrupt the “tubule-like” structures formed by HUVECs seeded on Matrigel. Matrigel is an extracellular matrix rich in pro-angiogenic factors that stimulate single endothelial cells to assume an extended shape and produce a reticulum similar to a capillary network.

As shown in Figure 7 (Panels C-E), after a 1 h (Panels C and D) or 3 h (Panel E) incubation, the compound clearly disrupted the network of HUVECs, as compared with the control. After 3 h, all the tested concentrations were effective in altering the tubule-like structures (Figure 7, Panel C). Image analysis was performed to obtain a quantitative measurement of the total length of the tubules, the area and the number of meshes, the percent of area covered by HUVECs, and the number of branching points after both a 1 h (Figure 7, Panel D) and 3 h (Figure 7, Panel E) treatment. It is important to stress that 3g exerted its antivasclualr effects in vitro at concentrations that did not affect HUVEC proliferation (see Table 2).

The antivasclualr activity of 3g was also investigated in vivo. First, we used the chick embryo chorioallantoic membrane (CAM), which is a highly vascularized structure, as a model. Through alginate beads applied on the CAM, 3g (1-100 pmol/egg) was slowly distributed within the membrane, starting from day 11 post egg fertilization, in the presence or absence of fibroblast growth factor (FGF) (100 ng/egg), a vascular growth factor. As shown in Figure 8 (Panel A), 3g alone, at the highest concentration (100 pmol/egg) used, did not induce blood vessels to increase in number. On the other hand, treatment with FGF gave rise to an extensive production of blood vessels, and this increase was strongly reduced by 3g treatment, even at the lowest tested concentration (1 pmol/egg).
3g was further evaluated in a murine tumor model. BL6-B16 mouse melanoma cells, injected subcutaneously in syngeneic C57/BL6 mice, proliferate and generate tumor masses. After a 24 h treatment with 3g at 30 mg/kg i.p., the tumor was excised and the blood vessels stained with an antibody against the endothelial marker CD31 and counted. As shown in Figure 8 (Panel B), the number and, especially, the size of the vessels were reduced. This reduction in number was about 20% and was statistically significant (Panel C, P < 0.05). Altogether our results indicate that 3g is endowed with vascular disrupting properties both in vitro and in vivo. In addition, we also observed that the effects on endothelial cells induced by 3g were similar to those observed after CA-4 treatment under the same experimental conditions, as described previously.43

Conclusions

In conclusion, we demonstrated that the bioisosteric replacement of the carbonyl bridge between the C-3 position of the benzo[b]furan ring and the 3,4,5-trimethoxyphenyl moiety by an anilinic nitrogen resulted in highly bioactive antimitotic agents based on the 2-alkoxycarbonyl-3-(3′,4′,5′-trimethoxyanilino)benzo[b]furan molecular skeleton. Compounds 3g and 3h were prepared by an efficient two-step synthetic procedure, and both compounds showed activity comparable with that of CA-4. Our structure-activity relationship studies involved placing the electron-donating methoxy substituent at the C-4, C-5, C-6 or C-7 position on the benzo[b]furan ring. For both the series of alkoxycarbonyl derivatives, compounds 3c and 3d with the methoxy group at the C-4 position were inactive, and a substantial improvement in antiproliferative activity occurred with the methoxy group at the C-5 position (3e and 3f). Simply moving the methoxy group to C-6 resulted in the highly active compounds 3g and 3h, while moving the methoxy to C-7 (3i and 3j) resulted in a drastic reduction in activity. The 2-methoxycarbonyl-3-(3′,4′,5′-trimethoxyanilino)-6-methoxybenzo[b]furan derivative 3g had the greatest antiproliferative IC$_{50}$ values, ranging
from 0.3 to 27 nM against the seven cancer cell lines we examined. Compound 3g was also a potent inhibitor of tubulin assembly, with an IC$_{50}$ of 1.1 µM, similar to that of CA-4. Nevertheless, this compound was less active than CA-4 as an inhibitor of the binding of [³H]colchicine to tubulin, with 83% and 99% inhibition, respectively. Compound 3g, in vitro was able to induce mitotic arrest followed by apoptosis through mitochondrial depolarization and activation of both caspase-9 and -3. Importantly, it exhibited significant antitumor activity in vivo and interesting antivascular properties. Thus, 3g is a promising new tubulin binding agent with potential as an antitumor and antivascular agent that could improve common anticancer therapies.
Experimental Section

Chemistry. Materials and methods. $^1$H NMR and $^{13}$C NMR spectra were recorded in CDCl$_3$ solution with a Varian Mercury Plus 400 spectrometer at 400 MHz and 100 MHz, respectively. Peak positions are given in parts per million (δ) downfield from tetramethylsilane as internal standard, and J values are given in hertz. Positive-ion electrospray ionization (ESI) mass spectra were measured on a double-focusing Finnigan MAT 95 instrument with BE geometry. High resolution mass spectroscopic (HRMS) measurements were performed using an ESI-Q-TOF mass spectrometer (Agilent Technologies). Analytical HPLC analyses were performed at ambient temperature on a Beckman 125 liquid chromatograph fitted with a Luna C-18 column (4.6 x 100 mm, 3 μm particle size) with 0.1% TFA in H$_2$O (A) and 0.1% TFA in CH$_3$CN (B) solvent mixtures and equipped with a Beckman 168 diode array detector. Melting points (mp) were determined on a Buchi-Tottoli apparatus and are uncorrected. The purity of tested compounds was determined by combustion elemental analyses conducted by the Microanalytical Laboratory of the Chemistry Department of the University of Ferrara with a Yanagimoto MT-5 CHN recorder elemental analyzer. All tested compounds yielded data consistent with a purity of at least 95% as compared with the theoretical values. All reactions were carried out under an inert atmosphere of dry nitrogen, unless otherwise indicated. TLC was performed on silica gel (precoated F254 Merck plates), and compounds were visualized with aqueous KMnO$_4$. Flash column chromatography was performed using 230-400 mesh silica gel and the indicated solvent system. Organic solutions were dried over anhydrous Na$_2$SO$_4$. All commercial chemicals and solvents were reagent grade and were used without further treatment.

General procedure A for the synthesis of compounds 5a-l. A suspension of the appropriate 2-hydroxybenzonitrile 4a-f (5 mmol), methyl/ethylbromoacetate (6 mmol, 1.2 equiv.) and
K₂CO₃ (1.38 g., 10 mmol, 2 equiv.) in DMF (10 mL) was stirred at 60 °C for 4 h until consumption of the limiting reagent, followed by reflux heating for 8 h. The reaction mixture was cooled to ambient temperature and filtered through Celite, then the filtrate was evaporated in vacuo. The residue was dissolved with ethyl acetate (30 mL), and the solution was washed sequentially with water (10 mL) and brine (10 mL). The organic layer was dried, filtered and concentrated under reduced pressure, and the residue was purified by flash column chromatography on silica gel.

**Methyl 3-amino-benzofuran-2-carboxylate (5a).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 2:8 (v:v) as eluent, to furnish **5a** as a yellow solid. Yield: 78%, mp 95-96 °C. \( ^1\text{H-NMR (CDCl}_3 \\delta \): 3.97 (s, 3H), 4.99 (bs, 2H), 7.24 (m, 1H), 7.46 (m, 2H), 7.56 (dd, \( J=7.8 \) and \( J=1.0 \) Hz, 1H). MS (ESI): [M]⁺=191.5.

**Ethyl 3-amino-benzofuran-2-carboxylate (5b).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 2:8 (v:v) as eluent, to furnish **5b** as a green solid. Yield: 72%, mp 83-84 °C. \( ^1\text{H-NMR (CDCl}_3 \\delta \): 1.40 (t, \( J=7.2 \) Hz, 3H), 4.46 (q, \( J=7.2 \) Hz, 2H), 4.97 (bs, 2H), 7.24 (m, 1H), 7.46 (m, 2H), 7.57 (dd, \( J=7.8 \) and \( J=1.0 \) Hz, 1H). MS (ESI): [M+1]⁺=206.1.

**Methyl 3-amino-4-methoxybenzofuran-2-carboxylate (5c).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish **5c** as a white solid. Yield: 75%, mp 148-149 °C. \( ^1\text{H-NMR (CDCl}_3 \\delta \): 3.94 (s, 3H), 3.96 (s, 3H), 5.40 (bs, 2H), 6.58 (d, \( J=7.8 \) Hz, 1H), 6.99 (d, \( J=8.4 \) Hz, 1H), 7.54 (t, \( J=8.4 \) Hz, 1H). MS (ESI): [M+1]⁺=221.2.
Ethyl 3- amino-4- methoxybenzofuran-2-carboxylate (5d). Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5d as a colorless oil. Yield: 58%. \(^1\)H-NMR (CDCl\(_3\)) \(\delta\): 1.42 (t, \(J=7.2\ Hz, 3H\)), 3.95 (s, \(3H\)), 4.38 (q, \(J=7.2\ Hz, 2H\)), 5.42 (bs, \(2H\)), 6.55 (d, \(J=8.2\ Hz, 1H\)), 7.04 (d, \(J=8.6\ Hz, 1H\)), 7.32 (t, \(J=8.6\ Hz, 1H\)). MS (ESI): [M+1]^+=236.3.

Methyl 3- amino-5- methoxy-benzofuran-2-carboxylate (5e). Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 4:6 (v:v) as eluent, to furnish 5e as a brown solid. Yield: 63%, mp 163-165 °C. \(^1\)H-NMR (CDCl\(_3\)) \(\delta\): 3.86 (s, \(3H\)), 3.96 (s, \(3H\)), 4.90 (bs, \(2H\)), 6.92 (d, \(J=2.4\ Hz, 1H\)), 7.06 (dd, \(J=9.2\ and 2.4\ Hz, 1H\)), 7.61 (d, \(J=9.2\ Hz, 1H\)). MS (ESI): [M+1]^+=222.2.

Ethyl 3- amino-5- methoxy-benzofuran-2-carboxylate (5f). Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5f as a yellow solid. Yield: 53%, mp 151-153 °C. \(^1\)H-NMR (CDCl\(_3\)) \(\delta\): 1.43 (t, \(J=7.0\ Hz, 3H\)), 3.86 (s, \(3H\)), 4.45 (q, \(J=7.0\ Hz, 2H\)), 4.89 (bs, \(2H\)), 6.92 (d, \(J=2.4\ Hz, 1H\)), 7.05 (dd, \(J=9.0\ and 2.4\ Hz, 1H\)), 7.33 (d, \(J=9.0\ Hz, 1H\)). MS (ESI): [M+1]^+=236.2.

Methyl 3- amino-6- methoxybenzofuran-2-carboxylate (5g). Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5g as a cream colored solid. Yield: 73%, mp 150-151 °C. \(^1\)H-NMR (CDCl\(_3\)) 3.84 (s, \(3H\)), 3.94 (s, \(3H\)), 4.97 (bs, \(2H\)), 6.83 (dd, \(J=8.6\ and 2.2\ Hz, 1H\)), 6.91 (d, \(J=2.2\ Hz, 1H\)), 7.39 (d, \(J=8.6\ Hz, 1H\)). MS (ESI): [M+1]^+=222.1.
**Ethyl 3-amino-6-methoxybenzofuran-2-carboxylate (5h).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5h as a yellow solid. Yield: 52%, mp 145-147 °C. $^1$H-NMR ($d_6$-DMSO) 1.43 (t, J=7.0 Hz, 3H), 3.85 (s, 3H), 4.40 (q, J=7.0 Hz, 2H), 4.95 (bs, 2H), 6.85 (dd, J=8.8 and 2.2 Hz, 1H), 6.93 (d, J=2.2 Hz, 1H), 7.43 (d, J=8.8 Hz, 1H). MS (ESI): [M+1]$^+$=236.2.

**Methyl 3-amino-7-methoxybenzofuran-2-carboxylate (5i).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5i as a brown solid. Yield: 61%, mp 149-151 °C. $^1$H-NMR (CDCl$_3$) 3.94 (s, 3H), 3.98 (s, 3H), 4.96 (bs, 2H), 6.91 (dd, J=7.0 and 2.0 Hz, 1H), 7.14 (m, 2H). MS (ESI): [M+1]$^+$=222.1.

**Ethyl 3-amino-7-methoxybenzofuran-2-carboxylate (5j).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5j as a yellow solid. Yield: 78%, mp 123-125 °C. $^1$H-NMR (CDCl$_3$) 1.42 (t, J=7.0 Hz, 3H), 3.99 (s, 3H), 4.40 (q, J=7.0 Hz, 2H), 4.95 (bs, 2H), 6.90 (dd, J=6.8 and 1.8 Hz, 1H), 7.13 (m, 2H). MS (ESI): [M+1]$^+$=236.2.

**Methyl 3-amino-7-ethoxybenzofuran-2-carboxylate (5k).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 5k as a yellow solid. Yield: 58%, mp 139-141 °C. $^1$H-NMR (CDCl$_3$) 1.50 (t, J=7.2 Hz, 3H), 3.94 (s, 3H), 4.21 (q, J=7.2 Hz, 2H), 4.95 (bs, 2H), 6.91 (dd, J=6.8 and 2.2 Hz, 1H), 7.12 (m, 2H). MS (ESI): [M+1]$^+$=236.3.

**Ethyl 3-amino-7-ethoxybenzofuran-2-carboxylate (5l).** Following general procedure A, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7
(v:v) as eluent, to furnish 5f as a yellow solid. Yield: 62%, mp 112-114 °C. $^1$H-NMR (CDCl$_3$)

1.42 (t, J=7.2 Hz, 3H), 1.51 (t, J=7.0 Hz, 3H), 4.26 (q, J=7.2 Hz, 2H), 4.41 (q, J=7.0 Hz, 2H), 4.93 (bs, 2H), 6.94 (dd, J=7.0 and 2.2 Hz, 1H), 7.12 (m, 2H). MS (ESI): [M+1]$^+$=250.3.

General procedure B for the preparation of compounds 3a-l. To a dry Schlenk tube, dry toluene (5 mL), 3-aminobenzofuran derivative 5a-l (0.5 mmol), Pd(OAc)$_2$ (6 mol%, 30 mg), $\text{rac}$-BINAP (4 mol%, 30 mg), CsCO$_3$ (230 mg, 0.7 mmol, 1.4 equiv.) and 5-bromo-1,2,3-trimethoxybenzene (148 mg, 0.6 mmol, 1.2 equiv.) were added under Ar, and the mixture was heated with stirring at 120 °C for 18 h. Upon cooling, ethyl acetate was added (5 mL), the mixture was filtered through Celite under vacuum and the filtrate diluted with ethyl acetate (10 mL) and water (5 mL). The aqueous phase was separated and further extracted with ethyl acetate (2x5 mL). The combined organic phases were washed with brine (5 mL), dried, concentrated under reduced pressure and yielded a residue that was purified by flash column chromatography on silica gel.

Methyl 3-[(3,4,5-trimethoxyphenyl)amino]-benzofuran-2-carboxylate (3a). Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 2:8 (v:v) as eluent, to furnish 3a as a yellow solid. Yield: 67%, mp 176-178 °C. $^1$H-NMR (CDCl$_3$) δ: 3.77 (s, 6H), 3.87 (s, 3H), 4.00 (s, 3H), 6.42 (s, 2H), 7.05 (m, 1H), 7.34 (d, J=7.8 Hz, 1H), 7.48 (m, 2H), 7.74 (s, 1H). $^{13}$C-NMR (CDCl$_3$) δ: 51.9, 56.2 (2x), 61.2, 99.6 (2x), 112.8, 117.8, 120.9, 122.1, 123.6, 128.8, 136.8, 137.1, 153.6 (2x), 154.6, 157.3. MS (ESI): [M+1]$^+$=357.9. Anal. (C$_{19}$H$_{19}$NO$_6$) C, H, N.

Ethyl 3-[(3,4,5-trimethoxyphenyl)amino]-benzofuran-2-carboxylate (3b). Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3b as a yellow solid. Yield: 56%, mp
122-124 °C. $^1$H-NMR (CDCl$_3$) δ: 1.46 (t, J=7.0 Hz, 3H), 3.77 (s, 6H), 3.86 (s, 3H), 4.45 (q, J=7.0 Hz, 2H), 6.41 (s, 2H), 7.12 (m, 1H), 7.32 (d, J=7.8 Hz, 1H), 7.54 (m, 2H), 7.80 (s, 1H).

$^{13}$C-NMR (CDCl$_3$) δ: 14.6, 56.1 (2x), 60.8, 61.1, 99.4 (2x), 109.9, 112.8, 117.8, 120.9, 121.9, 123.5, 128.6, 136.5, 126.8, 153.5 (2x), 154.4, 158.1. MS (ESI): [M+1]$^+$=372.4. Anal. (C$_{20}$H$_{21}$NO$_6$) C, H, N.

**Methyl 3-(3,4,5-trimethoxyphenylamino)-4-methoxybenzofuran-2-carboxylate (3c).**

Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3c as a white solid. Yield: 63%, mp 171-172 °C. $^1$H-NMR (CDCl$_3$) δ: 3.66 (s, 6H), 3.78 (s, 3H), 3.84 (s, 3H), 3.91 (s, 3H), 6.38 (s, 2H), 7.02 (dd, J=8.6 and 2.0 Hz, 1H), 7.32 (d, J=2.0 Hz, 1H), 7.48 (d, J=8.6 Hz, 1H), 7.77 (s, 1H). $^{13}$C-NMR (CDCl$_3$) δ: 51.8, 53.2, 56.8 (2x), 60.9, 99.6 (2x), 105.2, 105.9, 107.2, 119.4, 124.6, 127.7, 135.1, 135.8, 153.6 (2x), 155.8, 155.9, 163.3. MS (ESI): [M+1]$^+$=388.2. Anal. (C$_{20}$H$_{21}$NO$_7$) C, H, N.

**Ethyl 3-(3,4,5-trimethoxyphenylamino)-4-methoxybenzofuran-2-carboxylate (3d).**

Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3d as a yellow solid. Yield: 61%, mp 83-85 °C. $^1$H-NMR (CDCl$_3$) δ: 1.44 (t, J=7.2 Hz, 3H), 3.68 (s, 6H), 3.76 (s, 3H), 3.94 (s, 3H), 4.32 (q, J=7.2 Hz, 2H), 6.32 (s, 2H), 6.49 (d, J=8.2 Hz, 1H), 6.95 (d, J=8.6 Hz, 1H), 7.34 (t, J=8.6 Hz, 1H), 7.77 (s, 1H). $^{13}$C-NMR (CDCl$_3$) δ: 14.4, 51.8, 53.3, 56.7 (2x), 99.6 (2x), 104.5, 105.2, 105.7, 107.0, 118.8, 124.5, 127.9, 135.0, 135.6, 153.8 (2x), 155.9, 160.0, 163.8. MS (ESI): [M+1]$^+$=402.2. Anal. (C$_{21}$H$_{23}$NO$_7$) C, H, N.

**Methyl 3-(3,4,5-trimethoxyphenylamino)-5-methoxybenzofuran-2-carboxylate (3e).**

Following general procedure B, the crude residue was purified by flash chromatography, using
ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3e as a yellow solid. Yield: 53% yield, mp 140-142 °C. $^1$H-NMR (CDCl$_3$) $\delta$: 3.65 (s, 3H), 3.79 (s, 6H), 3.86 (s, 3H), 3.99 (s, 3H), 6.48 (s, 2H), 6.68 (d, J=2.8 Hz, 1H), 7.07 (dd, J=9.0 and 2.8 Hz, 1H), 7.42 (d, J=9.0 Hz, 1H), 7.78 (s, 1H). $^{13}$C-NMR (CDCl$_3$) $\delta$: 51.9, 55.9, 56.2 (2x), 61.2, 99.3 (2x), 104.5, 112.8, 113.5, 113.8, 116.5, 118.9, 132.2, 132.6, 135.8, 136.9, 153.6 (2x), 158.2. MS (ESI): [M+1]^+=388.0. Anal. (C$_{20}$H$_{21}$NO$_7$) C, H, N.

**Ethyl 3-(3,4,5-trimethoxyphenylamino)-5-methoxybenzofuran-2-carboxylate (3f).**

Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3f as a yellow solid. Yield: 56% yield, mp 105-107 °C. $^1$H-NMR (CDCl$_3$) $\delta$: 1.46 (t, J=7.0 Hz, 3H), 3.65 (s, 3H), 3.79 (s, 3H), 3.86 (s, 3H), 4.44 (q, J=7.0 Hz, 2H), 6.40 (s, 2H), 6.69 (d, J=2.8 Hz, 1H), 7.07 (dd, J=9.2 and 2.8 Hz, 1H), 7.43 (d, J=9.2 Hz, 1H), 7.70 (s, 1H). $^{13}$C-NMR (CDCl$_3$) $\delta$: 14.7, 55.9, 55.2 (2x), 60.9, 61.2, 99.1 (2x), 104.5, 113.6, 118.8, 121.3, 128.9, 134.4, 136.4, 137.0, 149.6, 153.6 (2x), 154.9, 161.9. MS (ESI): [M+1]^+=402.2. Anal. (C$_{21}$H$_{23}$NO$_7$) C, H, N.

**Methyl 3-(3,4,5-trimethoxyphenylamino)-6-methoxybenzofuran-2-carboxylate (3g).**

Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3g as a yellow solid. Yield: 78%, mp 143-145 °C. $^1$H-NMR (CDCl$_3$) $\delta$: 3.78 (s, 6H), 3.85 (s, 3H), 3.86 (s, 3H), 3.97 (s, 3H), 6.42 (s, 2H), 6.71 (dd, J=8.8 and 1.8 Hz, 1H), 6.94 (d, J=1.8 Hz, 1H), 7.18 (d, J=8.8 Hz, 1H), 7.72 (s, 1H). $^{13}$C-NMR (CDCl$_3$) $\delta$: 51.7, 55.7, 56.2 (2x), 61.2, 95.8, 99.7 (2x), 112.3, 114.1, 120.1, 124.1, 136.5, 136.9, 153.6 (2x), 155.8, 156.1, 160.3, 161.3. MS (ESI): [M+1]^+=388.0. Anal. (C$_{20}$H$_{21}$NO$_7$) C, H, N. HRMS calculated for C$_{20}$H$_{21}$NO$_7$ (M+H)$^+$, 388.1391; found, 388.13909.
Ethyl 3-(3,4,5-trimethoxyphenylamino)-6-methoxybenzofuran-2-carboxylate (3h).

Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3h as a yellow solid. Yield: 57%, mp 110-112 °C. \(^1\)H-NMR (CDCl\(_3\)) \(\delta\): 1.45 (t, \(J=6.8\) Hz, 3H), 3.78 (s, 6H), 3.80 (s, 3H), 3.86 (s, 3H), 4.43 (q, \(J=6.8\) Hz, 2H), 6.42 (s, 2H), 6.70 (dd, \(J=8.8\) and 2.2 Hz, 1H), 6.96 (d, \(J=2.2\) Hz, 1H), 7.19 (d, \(J=8.8\) Hz, 1H), 7.77 (s, 1H). \(^{13}\)C-NMR (CDCl\(_3\)) \(\delta\): 14.7, 55.7, 56.2 (2x), 60.7, 61.2, 95.9, 99.5 (2x), 112.2, 113.1, 124.0, 125.9, 127.7, 136.6, 140.0, 153.6 (2x), 154.01, 156.2, 161.2. Ethyl 3-(3,4,5-trimethoxyphenylamino)-7-ethoxybenzofuran-2-carboxylate (3l).
Following general procedure B, the crude residue was purified by flash chromatography, using ethyl acetate:petroleum ether 3:7 (v:v) as eluent, to furnish 3l as a yellow solid. Yield: 52%, mp 149-151 °C. \(^1\)H-NMR (CDCl\(_3\)) \(\delta\): 1.41 (t, J=7.2 Hz, 3H), 1.53 (t, J=7.0 Hz, 3H), 3.77 (s, 6H), 3.85 (s, 3H), 4.24 (q, J=7.2 Hz, 2H), 4.44 (q, J=7.0 Hz, 2H), 6.40 (s, 2H), 6.90 (m, 2H), 6.97 (m, 1H), 7.75 (s, 1H). \(^{13}\)C-NMR (CDCl\(_3\)) \(\delta\): 14.6, 14.8, 56.0 (2x), 56.7, 61.1, 64.5, 99.21 (2x), 108.8, 110.4, 115.1, 122.6, 123.5, 133.9, 134.1, 136.1, 136.7, 136.9, 139.9, 153.5 (2x), 175.3. MS (ESI): [M+1]\(^+\)=416.2. Anal. (C\(_{22}\)H\(_{25}\)NO\(_7\)) C, H, N.

Molecular modeling. All molecular docking studies were performed on a MacPro dual 2.66GHz Xeon running Ubuntu 12.04. The simulations were carried out using two tubulin structures (http://www.rcsb.org/-PDB code: 1SA0; \(^{44}\) PDB code: 3HKC\(^{45}\)). Hydrogen atoms were added to the protein, using the Protonate 3D routine of the Molecular Operating Environment (MOE).\(^{46}\) Ligand structures were built with MOE and minimized using the
MMFF94x forcefield until a RMSD gradient of 0.05 kcal mol$^{-1}$ Å$^{-1}$ was reached. The docking simulations were performed using PLANTS. The docking results obtained using the two different protein structures were equivalent.

**Antiproliferative assays.** Human T-cell leukemia (Jurkat), human B-cell leukemia (RS4;11) and human promyelocytic leukemia (HL-60) cells were grown in RPMI-1640 medium, (Gibco, Milano, Italy). Breast adenocarcinoma (MCF-7), human non-small cell lung carcinoma (A549), human cervix carcinoma (HeLa) and human colon adenocarcinoma (HT-29) cells were grown in DMEM medium (Gibco, Milano, Italy). Both media were supplemented with 115 units/mL of penicillin G (Gibco, Milano, Italy), 115 μg/mL of streptomycin (Invitrogen, Milano, Italy) and 10% fetal bovine serum (Invitrogen, Milano, Italy). These cell lines were purchased from ATCC. Stock solutions (10 mM) of the different compounds were obtained by dissolving them in dimethyl sulfoxide (DMSO). Individual wells of a 96-well tissue culture microtiter plate were inoculated with 100 μL of complete medium containing 8x10$^3$ cells. The plates were incubated at 37 °C in a humidified 5% CO$_2$ incubator for 18 h prior to the experiments. After medium removal, 100 μL of fresh medium containing the test compound at different concentrations was added to each well and incubated at 37 °C for 72 h. The percentage of DMSO in the medium never exceeded 0.25%. This was also the maximum DMSO concentration in all cell-based assays described below. Cell viability was assayed by the (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide test as previously described. The IC$_{50}$ was defined as the compound concentration required to inhibit cell proliferation by 50%, in comparison with cells treated with the maximum amount of DMSO, which was considered 100% viability.

PBLs from healthy donors were obtained by separation on Lymphoprep (Fresenius KABI Norge AS) gradient. After extensive washing, cells were resuspended (1.0 x 10$^6$ cells/mL) in
RPMI-1640 with 10% fetal bovine serum and incubated overnight. For cytotoxicity evaluations in proliferating PBL cultures, non-adherent cells were resuspended at 5 x 10^5 cells/mL in growth medium containing 2.5 μg/mL PHA (Irvine Scientific). Different concentrations of the test compounds were added, and viability was determined 72 h later by the MTT test. For cytotoxicity evaluations in resting PBL cultures, non-adherent cells were resuspended (5 x 10^5 cells/mL) and treated for 72 h with the test compounds, as described above.

**Effects on tubulin polymerization and on colchicine binding to tubulin.** To evaluate the effect of the compounds on tubulin assembly *in vitro*, varying concentrations of compounds were preincubated with 10 μM bovine brain tubulin in glutamate buffer at 30 °C and then cooled to 0 °C. After addition of 0.4 mM GTP (final concentration), the mixtures were transferred to 0 °C cuvettes in a recording spectrophotometer and warmed to 30 °C. Tubulin assembly was followed turbidimetrically at 350 nm. The IC_{50} was defined as the compound concentration that inhibited the extent of assembly by 50% after a 20 min incubation. The ability of the test compounds to inhibit colchicine binding to tubulin was measured as described, except that the reaction mixtures contained 1 μM tubulin, 5 μM [3H]colchicine and 5 μM test compound.

**Flow cytometric analysis of cell cycle distribution.** 5 x 10^5 HeLa or Jurkat cells were treated with different concentrations of the test compounds for 24 h. After the incubation period, the cells were collected, centrifuged, and fixed with ice-cold ethanol (70%). The cells were then treated with lysis buffer containing RNase A and 0.1% Triton X-100 and then stained with propidium iodide (PI). Samples were analyzed on a Cytomic FC500 flow
cytometer (Beckman Coulter). DNA histograms were analyzed using MultiCycle for Windows (Phoenix Flow Systems).

**Apoptosis assay.** Cell death was determined by flow cytometry of cells double stained with annexin V/FITC and PI. The Coulter Cytomics FC500 (Beckman Coulter) was used to measure the surface exposure of phosphatidylserine on apoptotic cells according to the manufacturer’s instructions (Annexin-V Fluos, Roche Diagnostics).

**Assessment of mitochondrial changes.** The mitochondrial membrane potential was measured with the lipophilic cationic dye JC-1 (Molecular Probes), as described. The production of ROS was measured by flow cytometry using H$_2$DCFDA (Molecular Probes), as previously described.

**Western blot analysis.** HeLa cells were incubated in the presence of 3g or 3h and, after different times, were collected, centrifuged, and washed two times with ice cold phosphate buffered saline (PBS). The pellet was then resuspended in lysis buffer. After the cells were lysed on ice for 30 min, lysates were centrifuged at 15000 x g at 4 °C for 10 min. The protein concentration in the supernatant was determined using the BCA protein assay reagents (Pierce, Italy). Equal amounts of protein (10 μg) were resolved using sodium dodecyl sulfate-polyacrylamide gel electrophoresis (7.5-15% acrylamide gels) and transferred to PVDF Hybond-P membrane (GE Healthcare). Membranes were blocked with a 5% bovine serum albumin solution in Tween PBS, the membranes being gently rotated overnight at 4 °C. Membranes were then incubated with primary antibodies against Bcl-2, PARP, cleaved caspase-9, cdc25c (Cell Signaling), caspase-3 (Alexis), H2AX (Cell Signaling), p53 (Cell Signaling), cyclin B (Cell Signaling), p-cdc2$^{Tyr15}$ (Cell Signaling), Mcl-1 (Cell Signaling), or β-actin (Sigma-Aldrich) for 2 h at room temperature. Membranes were next incubated with
peroxidase labeled secondary antibodies for 60 min. All membranes were visualized using ECL Select (GE Healthcare) and exposed to Hyperfilm MP (GE Healthcare). To confirm equal protein loading, each membrane was stripped and reprobed with anti-β-actin antibody.

**Evaluation of antivascular activity in vitro.** HUVECs were prepared from human umbilical cord veins, as previously described. The adherent cells were maintained in M200 medium supplemented with Low Serum Growth Supplement, containing fetal bovine serum, hydrocortisone, hEGF, bFGF, heparin, gentamycin/amphotericin (Life Technologies, Monza, Italy). Once confluent, the cells were detached by treatment with a trypsin–EDTA solution and used in experiments from the first to sixth passages.

The motility assay for HUVECs was based on “scratch” wounding of a confluent monolayer. Briefly, HUVECs (1x10⁵) were seeded onto 0.1% collagen type I (BD Biosciences, Italy)-coated six well plates in complete medium until a confluent monolayer was formed. The cells were wounded using a pipette tip, and wells were washed with PBS to remove the detached cells. Then, the cells were treated with the test compounds, and, at different times from the scratch, the cells were photographed under a light microscope. At all indicated time points, the wound width was measured in four areas and compared with the initial width.

Matrigel matrix (Basement Membrane Matrix, BD Biosciences, Italy) was kept at 4 °C for 3 h, when 230 µL of Matrigel solution was added to each well of a 24-well plate. After gelling at 37°C for 30 min, gels were overlaid with 500 µL of medium containing 6 x 10⁴ HUVECs. The cells were incubated over Matrigel for 6 h to allow capillary tubes to form. Different concentrations of test compound were added in the cultures and incubated for different times, and the disappearance of existing vasculature was monitored and photographed (five fields for each well: the four quadrants and the center) at 10x magnification. Phase contrast images were
recorded using a digital camera and saved as TIFF files. Image analysis was carried out using ImageJ image analysis software, and the following dimensional parameters (percent area covered by HUVECs and total length of HUVECs network per field) and topological parameters (number of meshes and branching points per field) were estimated. Values were expressed as percent change from control cultures grown with complete medium.

**In vivo CAM assay in fertilized chicken eggs.** Alginate pellets containing 0.1-1.0 pmol per pellet of TR-644 or CA4 were grafted on the CAM of fertilized chicken eggs at day 11. After 72 h, new blood vessels converging toward the implant were counted at 5x magnification under a stereomicroscope.

**Antivascular activity in vivo.** Six week old C57BL/6 mice (Charles River, Calco, Italy) were injected subcutaneously into the dorsolateral flank with 10⁵ BL6-B16 murine melanoma cells in 200 μL of PBS. When tumor volume reached 300 mm³, animals were treated intraperitoneally with 3g (30 mg/kg) dissolved in DMSO (50 μl). Twenty-four hours later, tumors were harvested, embedded in OCT-compound (Bio-Optica) and immediately frozen in liquid nitrogen for immunohistochemical analysis, as previously described. Excised tumors were cut with a cryostat into 4-5 μm sections. Immunohistochemistry was performed by staining samples with rat anti-mouse CD31 antibody (1:200; BD Biosciences) and biotinylated goat anti-rat secondary antibody (1:100; BD Biosciences). Quantification was performed by counting the number of CD31 positive vessels in 5 fields per section, using a 40x objective.

**Antitumor activity in vivo.** The in vivo cytotoxic activity of compound 3g was investigated using a syngeneic murine hepatocellular carcinoma cell line (BNL 1ME A.7R.1) in Balb/c mice. Male mice, 8 weeks old, were purchased from Harlan (S. Pietro al Natisone Udine,
Italy), and tumors were induced by a subcutaneous injection in their dorsal region of $10^7$ cells in 200 µL of sterile PBS. Animals were randomly divided into four groups, and, starting on the second day, the first group was daily dosed intraperitoneally with 7 µL/g of vehicle (0.9% NaCl containing 5% polyethylene glycol 400 and 0.5% Tween 80). Groups two and three were treated with compound 3g at the doses of 5 or 10 mg/kg body weight, respectively. The fourth group received the reference compound CA-4P at 5 mg/kg body weight. Both compound 3g and CA-4P were dissolved in vehicle. Tumor sizes were measured daily for 7 days using a pair of calipers. Tumor volume ($V$) was calculated by the rotational ellipsoid formula: $V = A \times B^2/2$, where $A$ is the longer diameter (axial) and $B$ is the shorter diameter (rotational). All experimental procedures followed guidelines recommended by the Institutional Animal Care and Use Committee of Padova University.

**Statistical analysis.** Unless indicated otherwise, results are presented as mean ± S.E.M. The differences between different treatments were analyzed using the two-sided Student’s $t$ test. $P$ values less than 0.05 were considered significant.

**Supporting information available.** HPLC traces and HRMS spectrum of compounds 3g and 3h. Molecular formula strings in csv format. This material is available free of charge via the Internet at [http://pubs.acs.org](http://pubs.acs.org).

\(^a\) Inhibition of tubulin polymerization. Tubulin was at 10 µM.

\(^b\) Inhibition of [\(^3\)H]colchicine binding. Tubulin, colchicine and tested compound were at 1, 5 and 5 µM, respectively.

n.d.: not determined
Figure Legends

Figure 1. Proposed binding of 3g (represented in magenta) in the colchicine site of tubulin (PDB:3HKC). The co-crystallized ligand N-[2-[(4-Hydroxyphenyl)amino]-3-pyridinyl]-4-methoxybenzenesulfonamide (ABT751) is represented in green.

Figure 2. Percentage of cells in each phase of the cell cycle in Jurkat (Panel A) and HeLa (Panel B) cells treated with 3g or 3h at the indicated concentrations for 24 h. Cells were fixed and labeled with PI and analyzed by flow cytometry as described in the Experimental section. Panel C. Western blot analysis of some G2/M regulatory proteins after treatment with 3g or 3h. HeLa cells were treated for 24 or 48 h with the indicated concentration of compound. The cells were harvested and lysed for the detection of cyclin B, p-cdc2Y15 and cdc25c expression. To confirm equal protein loading, each membrane was stripped and reprobed with anti-β-actin antibody.

Figure 3. Flow cytometric analysis of apoptotic cells after treatment of HeLa cells with 3g or 3h at the indicated concentrations after incubation for 24 (Panel A) or 48 h (Panel B). The cells were harvested and labeled with annexin-V-FITC and PI and analyzed by flow cytometry.

Figure 4. A) Assessment of mitochondrial membrane potential (ΔΨmt) after treatment of HeLa cells with compounds 3g or 3h. Cells were treated with the indicated concentration of compounds for 24 or 48 h and then stained with the fluorescent probe JC-1. Data are presented as mean ± S.E.M. of three independent experiments. B) Mitochondrial production of ROS in HeLa cells following treatment with compound 3g or compound 3h. After 24 or 48 h incubations, cells were stained with H2-DCFDA and analyzed by flow cytometry. Data are presented as mean ± S.E.M. of three independent experiments.
Figure 5. Western blot analysis of H2AX, Bcl-2 Mcl-1, caspase-3, cleaved caspase-9 and PARP after treatment of HeLa cells with 3g or 3h at the indicated concentrations for the indicated times. To confirm equal protein loading, each membrane was stripped and reprobed with anti-β-actin antibody.

Figure 6. Inhibition of mouse allograft growth in vivo by compound 3g. (A). Male mice were injected subcutaneously at their dorsal region with $10^7$ BNL 1MEA.7R.1 cells, a syngenic hepatocellular carcinoma cell line. Tumor-bearing mice were administered the vehicle, as control, or 3g at the doses of 5 mg/kg or 10 mg/kg or CA-4P (5 mg/kg) as reference compound. Injections were given intraperitoneally daily starting on day 1. The figure shows the average measured tumor volumes (A) and body weights of the mice (B) recorded at the beginning and at the end of the treatments. Data are presented as mean ± SEM of tumor volume and body weight at each time point for 5 animals per group. *p<0.01, vs. control.

Figure 7. Compound 3g has antivascular activity in vitro. Panel A. Confluent HUVECs in a monolayer were wounded, and cells were treated with different concentrations of 3g and photographed at various times, 7x magnification; bar=100 µm. The dotted lines define the areas lacking cells. Panel B. The graph shows the quantitative effect of 3g. Migration was quantified by measuring the gap closure at the indicated times. Data are represented as mean ± S.E.M. of three independent experiments. *p<0.05, **p<0.01 vs control. Panel C. Inhibition of endothelial cell capillary-like tubule formation by 3g. Representative pictures (10x magnification; bar=100 µm) of preformed capillary-like tubules treated with increasing concentration of 3g for 1 h or 3 h. Panels D and E. Quantitative analysis of the effects of 3g on the dimensional and topological parameters of the preformed capillary-like tubule networks, after a 1 h (panel D) or a 3 h treatment (panel E). Data are represented as mean ± S.E.M. of three independent experiments.
**Figure 8.** *In vivo* effects of **3g** on angiogenesis. A. The CAM assay. Alginate sponges embedded with FGF, a stimulator of blood vessel formation, in the presence of the indicated concentrations of **3g**, were implanted on the top of the growing CAM on day 11 of development. On day 14, newly formed blood vessels converging toward the implants were counted microscopically. Data represent mean ±SEM of at least six eggs for each group. ***p<0.001 vs control. B and C. Efficacy *in vivo* of **3g** in a syngeneic mouse model. B. BL6-B16 murine melanoma cells were injected in the right flank of C57BL/6 mice as described in the Experimental Section. Tumor tissues were embedded in OCT-compound and frozen for immunohistochemistry. CD31 immunohistochemistry and hematoxylin-eosin (HE) staining of tumor after i.p. treatment with 30 mg/kg of **3g** (100x magnification). C. Quantitative analysis of tumor section stained with CD31 for blood vessel number. Data are represented as mean±SEM of five mice per group. *P < 0.05 versus control.

Scheme 1

4a, R₄,₇=H
4b, R₄=OCH₃, R₅,₇=H
4c, R₅=OCH₃, R₄,₆,₇=H
4d, R₆=OCH₃, R₄,₅,₇=H
4e, R₇=OCH₃, R₄,₆=H
4f, R₇=OC₂H₅, R₄,₇=H

3a, 5a, R₂=CH₃, R₄,₇=H,
3b, 5b, R₂=CH₅, R₄,₇=H,
3c, 5c, R₂=CH₃, R₄=OCH₃, R₅,₇=H
3d, 5d, R₂=CH₂H₅, R₄=OCH₃, R₅,₇=H
3e, 5e, R₂=CH₃, R₅=OCH₃, R₄,₆,₇=H
3f, 5f, R₂=CH₂H₅, R₅=OCH₃, R₄,₅,₇=H
3g, 5g, R₂=CH₃, R₅=OCH₃, R₄,₅,₇=H
3h, 5h, R₂=CH₂H₅, R₆=OCH₃, R₄,₅,₇=H
3i, 5i, R₂=CH₃, R₇=OCH₃, R₄,₆=H
3j, 5j, R₂=CH₂H₅, R₇=OCH₃, R₄,₆=H
3k, 5k, R₂=CH₃, R₇=OC₂H₅, R₄,₆=H
3l, 5l, R₂=CH₂H₅, R₇=OC₂H₅, R₄,₆=H

Reagents. a: BrCH₂CO₂CH₃ or BrCH₂CO₂C₂H₅, K₂CO₃, DMF, 60 °C for 4 h then reflux for 8 h:
b: 1-Bromo-3,4,5-trimethoxybenzene, Pd(OAc)₂, BINAP, Cs₂CO₃, PhMe, 100 °C, 16 h.
Table of Contents Graphic

3g

Anticancer and Antivascular activity

IC50: 0.3-0.7 μM against a panel of seven cancer cell lines
IC50: 1.1 μM in the tubulin polymerization assay
