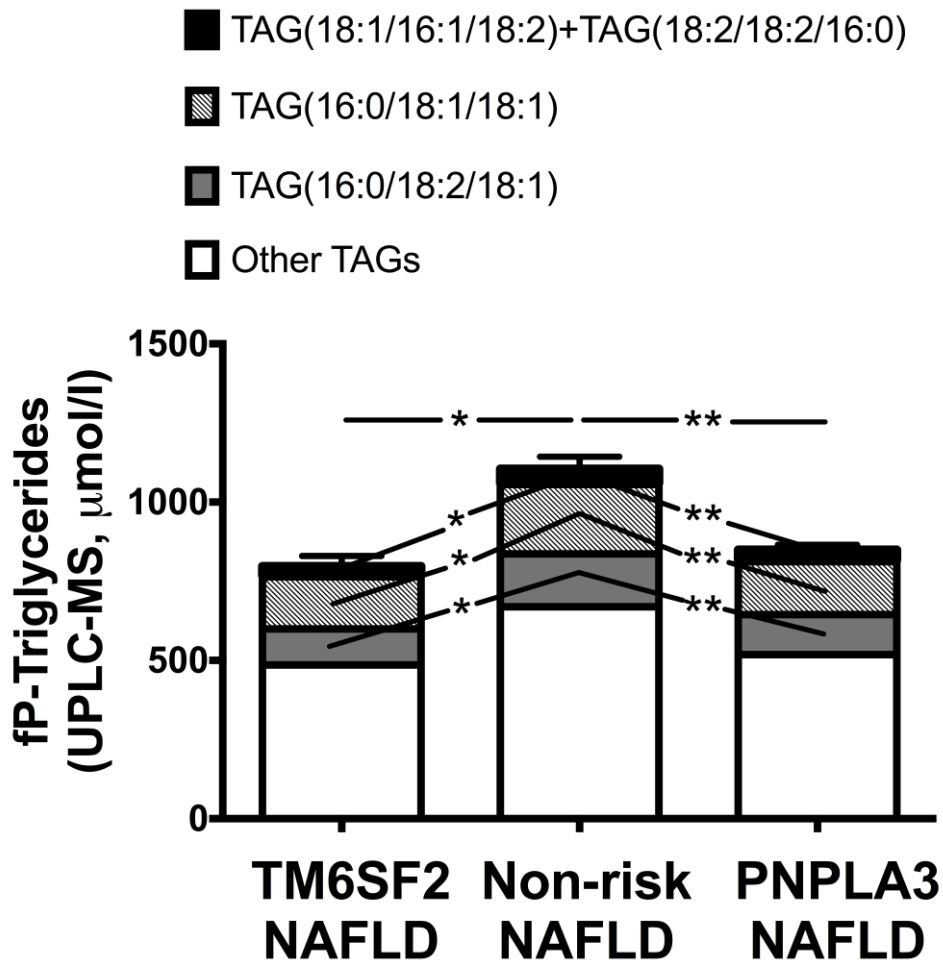
Supplementary Methods

Lipidomic analysis with UPLC-MS

For further identification of unknown lipids, fractions collected from UPLC run were infused to a LTQ-Orbitrap (Thermo Fischer Scientific, San Jose, CA) mass spectrometer by a TriVersa Nanomate (Advion Biosciences, Ithaca, NY) using chip-based nanoelectrospray in positive and negative ionization mode. Identifications were based on the exact mass and MS^n spectra. The instrument was calibrated externally according to the instructions of manufacturer. MS^2 and MS^3 were acquired using either low resolution or high resolution up to target mass resolution R = 60 000 at m/z 400. The normalized collision energies of 30-40% were applied in MS^n experiments.



Supplementary Fig. 1. Distribution of plasma TAG species in the 'TM6SF2 NAFLD', PNPLA3 NAFLD' and 'Non-risk NAFLD' groups. Total TAGs are shown as mean ± SEM. The significant differences in concentrations of total TAGs, TAG(16:0/18:2/18:1), TAG(16:0/18:1/18:1), TAG(18:1/16:1/18:2)+TAG(18:2/18:2/16:0) are indicated (*$p < 0.05$, **$p < 0.01$).

Supplementary Table 1. Composition of circulating lipid clusters
