The synthesis of some new thiophenyl-derivatized and furanyl-derivatized phenothiazine and phenoxazine dyestuffs is described. This was achieved by two methods after the synthesis of 6-chloro-5H-benzo[a]phenothiazin-5-one, 6-chloro-5H-benzo[a]phenoxazin-5-one, and 6-chloro-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one intermediates via anhydrous base condensation reaction of 2,3-dichloro-1,4-naphthoquinone with 2-aminothiophenol, 2-aminophenol, and 2-aminopyridinol, respectively. The first method involved treatment of tributyl(thien-2-yl) or tributyl(furan-2-yl) stannane with chlorophenothiazine/chlorophenoxazine under mild basic chemical formula (CsF) and 1,4-dioxane or toluene solvent at 80°C to supply dazzling yellow solid in high yields. In the second method, the catalytic system was pre-activated in acetonitrile, followed by addition of coupling partners and K_3PO_4 to obtain high melting and variety of highly colored products in moderate to high yields. The reaction conditions were compatible with unprotected N-H and carbonyl functional groups. The intense colors of these dyes and their ease of re-oxidation of $\text{Na}_2\text{S}_2\text{O}_4$ -reduced derivatives make them suitable as vat dyes. Also, they were found to be good colorants for textiles, papers, paint, ink, soap, polish, candle, and plastic materials.

INTRODUCTION

The plethora industrial applications of phenothiazine and phenoxazine and their derivatives stimulated our inter-est in synthesizing new derivatives of the parent rings 1 and 2 that may be useful as dyestuffs [1,2].

Compounds 1 and 2 were first prepared by Bernthsen in 1883 and 1887 by thionation of diphenylamine and thermal condensation of o-aminophenol with catechol (2-hydroxyphenol), respectively [3,4].

Originally, these compounds and their derivatives were mainly applied as dyes and pigments [5] in industries, but with time, they found wider applications as antioxidant in lubricants and fuel [6–9], polymerization stabilizers [10–12], pesticides/insecticides [13–15], biological stains or labelings [16–19], acid–base indicators [20], and as drugs [21]. Some phenothiazine derivatives, especially Lauth's violet 3 and Methylene blue 4, were known to be commercial dyestuffs even before the first synthesis of the parent

phenothiazine [1]. On the other hand, Meldola [22] had synthesized large numbers of phenoxazine derived dyes in the last quarter of the last century. Notable among them was Meldola's blue 5 which is a textile, paper and paint colorant.

Besides their well-known physiological activity profile, [23,24] because of their reversible oxidative reactions, which give rise to characteristic, deep colored radical cation absorptions, more recently, phenothiazine derivatives have become attractive spectroscopic probes in molecular arrangements for photoinduced electron transfer studies and as scientific motif materials [25,26]. Also, recent reports revealed that phenoxazine derivatives are widely applied as organic light emitting diodes [27,28].

Previously, derivatizations of these compounds were achieved by employing classical reactions, which are generally harsh and unamenable to sensitive functional groups. Burgess [29] noted in his review of benzophenoxazine-based dyes for labeling biomolecules that most of the synthetic protocols involved elevated temperature and were

based on procedure that are now over a century old and no contemporary synthetic methods were employed. However, in the recent time, a considerable variety of phenothiazine derivatives had been synthesized from iodo-substituted and/or bromo-substituted phenothiazine precursor via metal catalyzed cross-coupling reactions [30–34]. Grosu et al. [32] reported multistep synthesis of 3,7,10-substituted phenothiazine derivatives in which one of the steps involved Pd-catalyzed Suzuki–Miyaura cross-coupling of bromophenothiazines. Kramer [31] employed the Suzuki–Miyaura cross-coupling of bromophenothiazine in the synthesis of (hetero) aryl bridged and directly linked active phenothiazinyl dyads and triads.

In a similar reaction, bromophenothiazines were used as starting materials in the synthesis of phenothiazinyl acid derivatives via halogen–metal exchange and electrophilic borylation route [34] and synthesis of functionalized oligophenothiazines via one-pot bromine–lithium exchange–borylation–Suzuki coupling [33]. Muller [35,36] and his co-workers reported the synthesis of luminescent, redox-active diphenothiazine dumb-bells expanded by conjugated arenes and heteroarenes and 3-acceptor-substituted and 3,7-bisacceptor-substituted phenothiazine via Pd-catalyzed cross-coupling of bromophenothiazines. In our previous papers, we have reported the synthesis of new nonlinear polycyclic aza phenothiazine dyestuffs [37,38]. We have also recently reported the functionalization of phenothiazine and phenoxazine ring systems via Pd-catalyzed Suzuki–Miyaura cross-coupling reaction [39]. In continuation of our avid interest in developing new dyestuffs, we now report a convenient synthesis of new phenothiazine-derivatized and phenoxazine-derivatized dyestuffs employing Pd-catalyzed Stille cross-coupling protocols.

RESULTS AND DISCUSSION

Besides 2-chloro-10H-phenothiazine **6** that is commercially available for the palladium(0)/XPhos-mediated Stille cross-coupling, 6-chloro-5H-benzo[a]phenothiazin-5-one **9**, 6-chloro-5H-benzo[a]phenoxazin-5-one **10**, and 6-chloro-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one **11** were synthesized by employing the traditional [40,41]

anhydrous base-catalyzed reaction of 2,3-dichloro-1,4-naphthoquinone **8** with 2-aminothiophenol, 2-aminophenol, and 2-aminopyridin-3-ol **7** (Scheme 1).

Influenced particularly by the work of Buchwald and co-workers [42] who applied pre-milled palladium acetate and XPhos catalytic system in successful cross-coupling of sterically and electronically diverse aryl chlorides with organotin reagents, their protocol was adapted in this work. However, unlike Buchwald reaction protocol, the catalytic system was not pre-milled. Test experiments were conducted by reacting 2-chloro-10H-phenothiazine (1 mmol) with tributyl-(2-thienyl)stannane (1.2 mmol) in order to obtain 2-(thiophen-2-yl)-10H-phenothiazine **16** under a variety of conditions. Applying catalytic loadings of 4 mol% Pd(OAc)₂ and 7 mol% XPhos four experiments were set up using 3 mmol of Tetrabutylammoniumfluoride (TBAF), CsF, K₃PO₄, and K₂CO₃ respectively and 3 mL of 1,4-dioxane under N₂ atmosphere at the temperature of 80°C and reaction progress monitored with thin-layer chromatography. Full conversion of starting materials was observed within 4 h with CsF, about 50% conversion with K₃PO₄ and K₂CO₃ and none were recorded for TBAF even when reaction time was extended to 8 h. Yellow solid was isolated in 80% yield after reaction work-up and purification by flash column chromatography on silica gel using 20% dichloromethane–80% petroleum ether solvents. Spectroscopic and elemental analysis data correspond to molecular structure of compound and formula, C₁₆H₁₁NS₂. The proton nuclear magnetic spectra integration traces were consistent with 11 protons and in harmony with carbon signals supplied by carbon-13 nuclear magnetic resonance spectroscopy. This was further validated by molecular ion peak with m/z 281.0339 [(100), M⁺], found in mass spectrum. There was no significant difference in product yield when toluene and tertiary butanol solvents were used with CsF instead of 1,4-dioxane. The reaction scope was also expanded by coupling 2-chloro-10H-phenothiazine (1 mmol) with tributylfuranlystannane **13** to obtain 77% isolated yield of 2-(2-furanyl)-10H-phenothiazine **20**. Compound **20** is a shiny yellow powdery solid. It was believed the use of CsF enhanced the reaction rate as well the corresponding yields of the product because recent findings have associated increased reactivity

Scheme 1. Synthesis of reaction intermediates.

in Stille reactions to fluoride additive [43]. This was attributed to the formation of hypervalent fluorostannane anions **14**, which undergo labile transmetalation reactions (Scheme 2).

Buchwald practically recorded greatest enhancement with CsF [42]. Encouraged by these procedural developments, we applied them as a general protocol for the coupling of chlorophenothiazine and chlorophenoxazine substrates with organotin, but the reaction failed with the angular-fused chlorophenothiazines and chlorophenoxazines (**9–11**), generating only trace conversions. Initially, the failure of the reaction protocol to couple non-linear chlorophenothiazine and chlorophenoxazine substrates with organotin was attributed to the inability of the catalytic system to activate the aryl halide toward oxidative addition, which is generally known to be a crucial stage in the catalytic cycle. Hence, a modified protocol was sought. In this procedure, the catalyst and ligand was charged in a 10 mL round bottom (RB) flask and corked with rubber septum followed by air evacuation and corresponding back filling with N₂ gas four times before addition of predegassed solvent followed by warming to 50°C within 10 min. The rubber septum was immediately removed from flask to add ArCl and CsF and replaced again. This was followed by injection of 1.2 mmol of organostannane, and the reaction temperature was maintained under inert atmosphere for 30 min before increasing to 80°C. The isolated

Scheme 2. Formation and reaction of hypervalent fluoro-(2-thienyl) stannane anion.

products at the completion of the reaction gave over 70% yields dehalogenated product instead of 6-thiophenyl or 6-furanyl substituted products. For example, the reaction of 6-chloro-5H-benzo[*a*]phenothiazin-5-one **9** with tributylthienylstannane **12** gave 5H-benzo[*a*]phenothiazin-5-one **15** (Scheme 3). The proton nuclear resonance spectrum integrated accurately for nine aromatic protons with the proton in position 6 of the compound **15** found unusually upfield at 6.75 ppm probably due to the additive shielding effects conferred on it by the ring current and the carbonyl functional group.

The failure of the reaction to provide desired products compelled us to search for an alternative protocol to couple organostannanes to 6-chlorobenzo[*a*]phenothiazines and 6-chlorobenzo[*a*]phenoxazines **9–11** (Scheme 3). Reasoning C–Sn bond is more polar than C–B, we expected an enhanced transmetalation step for cross-coupling organostannanes over organoboranes. With this hypothesis, we invoked earlier reaction protocol [39] employed in cross-coupling of angular phenothiazine/phenoxazine chlorides with organoboranes to afford moderate isolated yields of derivatized products. The yield was further improved by first preactivating the catalyst-ligand system by warming in aqueous acetonitrile to 50°C before adding K₂CO₃, ArCl, and organostannane, and the reaction continued until satisfactory consumption of starting materials was observed (Scheme 4).

Encouraged by the result of this tested procedure, it was extended to the coupling of angular chlorophenothiazine/chlorophenoxazines with organostannane, and the results are presented in Table 1. The results show that moderate to high yields of derivatized products were obtained applying the developed procedure to five coupling reactions. The coupling of 2-chloro-10H-phenothiazine substrate with organostannanes gave the highest yields of products in shorter time and this may be attributed to higher electrophilicity as well as freer access to the reaction site of the substrate. The proton nuclear magnetic resonance spectroscopic chemical shifts for the aromatic protons of products **16–22** appeared in the range of 8.88–6.54 ppm with the integration traces in agreement with

Scheme 3. Pd(0)/XPhos-catalyzed Stille cross-coupling under various conditions.

Scheme 5. Proposed mechanism for Pd(0)/XPhos catalyzed Stille cross-coupling reactions.

the number of protons in the respective compounds. These results were nicely substantiated by carbon nuclear magnetic spectroscopic data, which furnished the number of peaks corresponding to the number of carbons in each compound in the range of 181.98–109.49 ppm. The carbonyl carbon of each compound were distinguishable from the rest and were found in 178.47, 181.91, 181.02, and 180.98 ppm at higher frequency than other sp^2 hybridized carbons, indicating that the carbonyl groups were well tolerated.

The prepared compounds were all colored and have strong absorptions in the visible region of the electromagnetic spectra (400–800 nm). They also exhibit slight red shifts due to their extended conjugations. Phenothiazine derivatives with extended π -conjugated substituents often display intense luminescence upon UV/vis excitation with Stokes shifts that might be due to solvent relaxation and, in part, to geometry changes in the excited state [25]. The electronic properties of these compounds have led to their applications as electrophore probes in supramolecular assemblies for photoinduced electron transfer and sensor studies and as electron-donor components in material

scientific investigations such as electrically conducting charge-transfer composites, polymers, Do-Acc arrangements, and also as chromophores in dye-sensitized photovoltaic cells [26]. Furthermore, derivatives 16–22 were found to be good colorants for textiles, papers, paint, ink, soap, polish, candle, and plastic and cosmetic products.

By using 6-chloro-5H-benzo[a]phenothiazine 9 electrophilic substrate, we propose a general plausible mechanism for the syntheses of derivatives 17–19, 21, and 22 (Scheme 5).

The reduction of compounds 17–19, 21, and 22 to their corresponding angular phenothiazinols/phenoxazinols was accomplished by using sodium dithionite. For example, 17 easily loses its reddish color on refluxing in sodium dithionite due to the formation of 6-(thiophen-2-yl)-12H-benzo[a]phenothiazin-5-ol compound 23 (Scheme 6). However, the reduced yellowish compound was too unstable to be isolated in their pure forms as they easily reverted under atmospheric condition to the intensely reddish colored oxidized iminoquinoid compound. This property makes the synthesized derivatives applicable as vat dyes.

Scheme 6. Reduction of thiophenylbenzophenothiazinone to thiophenylbenzophenothiazinol.

CONCLUSION

New and highly colored phenothiazine and phenoxazine dyes were prepared from Pd(0)/XPhos-catalyzed cross-coupling of chlorophenothiazines/chlorophenoxazines with organotins in moderate to high yields at relatively mild temperature. These dyestuffs were found to be good colorants for textiles, papers, paint, ink, soap, polish, candle, plastic and cosmetic materials.

EXPERIMENTAL

General information. All chemicals were purchased from Aldrich Chemical Company, UK, and were used without further purification. Otherwise stated, all compounds were synthesized and characterized in the School of Chemistry of Cardiff University, UK. Melting points were determined with a Fischer-Johns apparatus. ^1H and ^{13}C -NMR data were recorded with Bruker DPX 400 MHz spectrometers relative to tetramethylsilane as internal standard. All chemical shifts are reported in ppm (δ), and coupling constants (J) are reported in hertz. Multiplicity is indicated using the following abbreviations: br for broad, s for singlet, d for doublet, t for triplet, dd for doublet of doublets, and m for multiplet. The mass spectra data were obtained on a Varian 1200 Quadrupole Mass and Micromass Quadro II spectrometers. Elemental analysis was carried out with Thermo Quest Flash 1112 series (CHNS) Elemental Analyzer. UV-Visible spectra were recorded on Cecil 7500 Aquarius 7000 Series Spectrometer at Chemistry Advance Laboratory, Sheda Science and Technology Complex (Shestco) Abuja, Nigeria, using matched 1 cm quartz cells and methanol as solvent. The absorption maxima are recorded in nanometers (nm) and figures in parenthesis are $\log \epsilon$.

Synthesis of angular phenothiazine and phenoxazine intermediates. 6-Chloro-5H-benzo[a]phenothiazin-5-one (9). To a suspension of 2-aminothiophenol (2.5 g, 20 mmol) in chloroform (50 mL) was added Na_2CO_3 (2.12 g, 20 mmol) and the mixture warmed to boiling before addition of 2,3-dichloro-1,4-naphthoquinone (4.54 g, 20 mmol), and the entire mixture refluxed for 3 h while stirring with magnetic bar. The reaction mixture was cooled to room temperature, and solvent was distilled off in vacuum. Water (25 mL) was added to the dark solid stirred and filtered to remove inorganic salts and air-dried. The solid was recrystallized from benzene-toluene after treatment with activated charcoal to obtain reddish brown shiny solid (5.01 g, 84%), mp 228–230°C (Lit.⁴⁴ 232°C). δ_{H} (400 MHz CDCl_3): 8.87–8.84 (1H, m); 8.33–8.31 (1H, m); 7.97–7.94 (1H, m), 7.74–7.72 (2H, m); 7.54–7.42 (3H, m). δ_{C} (150 MHz CDCl_3): 173.85 (carbonyl carbon), 143.80, 138.41, 135.20, 134.10, 133.29, 132.00, 131.62,

130.21, 128.34, 126.53, 125.97, 125.33, 125.18, 123.55. UV-Visible λ_{max} (MeOH): 381.5 (4.06); 479 (3.21); 747.5 (3.97). IR (ν_{max} , cm^{-1}): 1640, 1593, 1578, 1510, 1290, 1155, 1090, 905, 855, 828, 777, 721, 681, 644. Found: C, 64.57; H, 2.74; N, 4.72; S, 10.79%. Molecular formula $\text{C}_{16}\text{H}_8\text{ClNOS}$ requires C, 64.54; H, 2.71; N, 4.70; S, 10.77%.

6-Chloro-5H-benzo[a]phenoxazin-5-one (10). A mixture of 2-aminophenol (2.18 g, 20 mmol) and KOH (2.24 g, 20 mmol) was stirred at room temperature for 0.5 h in methanol (100 mL) followed by addition of 2,3-dichloro-1,4-naphthoquinone (4.54 g, 20 mmol), and the entire reaction mixture was stirred at room temperature for 6 h. The solvent was distilled off in vacuum, and water (50 mL) was added to the yellowish brown solid, stirred, and filtered and solid further wash with 25 mL of 5% HCl and air-dried. The crude product was recrystallized from benzene-toluene after treatment with activated charcoal to give yellow-orange colored solid, yield 4.85 g (86%), mp 199–201°C (Lit.⁴⁵ 203°C). δ_{H} (400 MHz, CDCl_3): 8.68–8.66 (1H, m); 8.31–8.29 (1H, m); 7.81–7.79 (1H, dd, J = 7.80, 7.81); 7.76–7.68 (2H, m); 7.49–7.46 (1H, m); 7.41–7.33 (2H, m). δ_{C} (150 MHz CDCl_3): 177.46 (C 1 /O), 146.89, 146.15, 143.80, 132.63, 132.41, 132.09, 131.85, 131.44, 130.27, 129.93, 126.63, 125.85, 124.94, 116.19. UV-Vis λ_{max} (MeOH): 354.5 (3.88); 440 (3.54); 747 (4.01). IR (ν_{max} , cm^{-1}): 1640, 1570, 1330, 1310, 1280, 1250, 1150, 1100, 1010, 920, 840, 780, 760, 690. (Found: C, 68.92; H, 2.77; N, 4.78. Molecular formula $\text{C}_{16}\text{H}_8\text{ClNO}_2$ requires C, 68.22; H, 2.86; N, 4.97%.)

6-Chloro-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one (11). By a similar method to the synthesis of 4, 6-chloro-5H-naphtho[2,1-b]pyrido[2,3-e]oxazin-5-one was prepared from 2-aminopyridin-3-ol (2.20 g, 20 mmol), 2,3-dichloro-1,4-naphthoquinone (4.54 g, 20 mmol), and KOH (2.24 g, 20 mmol) in methanol (100 mL) as a yellow-orange solid, recrystallized from acetone after treatment with activated carbon (yields 4.47 g, 81%), mp 207–208°C. δ_{H} (400 MHz CDCl_3): 8.84–8.82 (1H, m); 8.62–8.61 (1H, dd, J = 8.61, 8.64); 8.32–8.30 (1H, m); 7.79–7.76 (3H, m), 7.45–7.43 (1H, d, J = 7.45). δ_{C} (150 MHz CDCl_3): 177.27 (carbonyl carbon), 150.23, 147.27, 146.09, 144.37, 140.68, 133.11, 132.93, 131.37, 129.83, 126.82, 126.21, 125.95, 124.59, 115.90. UV-Visible λ_{max} (MeOH): 350.5 (3.38); 441.0 (3.47); 746 (4.03). IR (ν_{max} , cm^{-1}): 1650, 1565, 1560, 1555, 1420, 1330, 1900, 1270, 1230, 1120, 1100, 1030, 920, 870, 810, 775, 710, 690. (Found: C, 68.31; H, 2.89; N, 5.01%. Molecular formula $\text{C}_{16}\text{H}_8\text{ClNO}_2$ requires C, 68.22; H, 2.86; N, 4.97%.)

General procedures for Stille reactions: Method 1.

To an oven-dried 10 mL RB flask was added Pd(OAc) $_2$ (8.92 mg, 4 mol%), XPhos (32.5 mg, 7 mol%), chlorophenothiazine (234 mg, 1 mmol%), and CsF (459 mg, 3 mmol), and the vessel was covered with a rubber septum. The flask was

evacuated and backfilled with N₂ thrice before injection of degassed dioxane or toluene (3 mL) and, as temperature of reaction mixture was gradually heated to 50°C tributyl-(2-thienyl)stannane (1.2 mmol), was injected into the flask. The temperature was maintained for 30 min before increasing to 80°C. The reaction was terminated in 4 h and cooled to room temperature. Reaction mixture was diluted with DCM (3 mL) and extracted from water (5 mL) with 5 mL of DCM four times. The combined

organic extract was dried with MgSO₄ and concentrated in vacuum. The crude product was purified by flash chromatography on silica gel using petroleum ether-ethyl acetate.

General procedures for Stille reactions: Method 2. An oven-dried 10 mL RB flask was charged with Pd(OAc)₂ (8.92 mg, 4 mol%) and XPhos (32.5 mg, 7 mol%) and covered with rubber septum. The vessel was evacuated and

backfilled with N₂ thrice before injecting CH₃CN (2 mL) and H₂O (1 mL) (both solvents degassed for 30 min), and the reaction mixture warmed to 50°C within 10 min. Rubber septum was quickly removed to charge with chlorophenothiazine (1 mmol) and K₃PO₄ (318 mg, 1.5 mmol) and replaced before injecting tributyl thienyl stannane or tributyl furanyl stannane (1.2 mmol). The temperature was maintained for 30 min before increasing to 80°C. The reaction was terminated in 5 h and diluted with DCM (5 mL), and the crude product was extracted from water (5 mL) four times with DCM. The combined organic extract was dried with MgSO₄ and concentrated in vacuum. The crude product was purified by flash chromatography on silica gel using petroleum ether-ethyl acetate eluent.

2-(Thiophen-2-yl)-10H-phenothiazine (16) (Table 1, entry 1). Method 1 was applied to convert tributyl 2-thienyl stannane and 2-chloro-10H-phenothiazine into the title product in 4 h. Purification by flash chromatography (5% EtOAc/95% pet. ether eluent) supplied the analytically pure yellow solid product (227.61 mg, 81%), mp 188–189°C. NMR: δ_H (400 MHz, acetone-d₆): 7.80 (1H, br, s); 7.28–7.27 (1H, dd, J = 7.27, 7.27); 7.22–7.20 (1H, d, J = 7.21); 6.99–6.94 (2H, m); 6.89–6.86 (4H, m); 6.69–6.59 (2H, m). δ_C (150 MHz, acetone-d₆): 144.35, 143.78, 142.90, 134.65, 129.01, 128.41, 128.28, 127.64, 127.20, 125.63, 123.95, 123.06, 120.20, 118.40, 118.17, 115.58, 112.37. UV-Visible λ_{max} (MeOH): 492.5 (4.03); 747.5 (3.99). HRMS (EI), m/z (% relative intensity): 83.0773 (2.0), 118.5283 (3.0), 140.5161 (7.0), 167.0773 (2.0), 191.0729 (3.0), 204.0827 (13.0), 217.0921 (5.0), 236.0547 (23), 266.0150 (2.0), 281.0339 [(100), M⁺]. (Found: C, 68.37; H, 4.03; N, 5.01; S, 22.86%. Molecular formula C₁₆H₁₁NS₂ requires C, 68.30; H, 3.94; N, 4.98; S, 22.79.)

6-(Thiophen-2-yl)-5H-benzo[a]phenothiazin-5-one (17) (Table 1, entry 2). Method 2 was used to convert tributyl 2-thienyl stannane and 6-chloro-5H-benzo[a]phenothiazin-

chromatography employing 10% EtOAc/90% pet. ether as eluent gave analytically pure dark brown solid product, yield 183 mg (53%), mp >200°C (dec). NMR: δ_H (400 MHz, CDCl₃): 8.88–8.85 (1H, m); 8.31–8.29 (1H, m); 7.91–7.89 (1H, d, J = 7.90); 7.76–7.67 (2H, m); 7.56–7.54 (1H, dd, J = 7.55, 7.51); 7.44–7.40 (1H, m); 7.37–7.32 (1H, dd, J = 7.28, 7.18); 7.18–7.17 (3H, m). δ_C (150 MHz, CDCl₃): 178.47, 144.77, 138.41, 136.95, 134.61, 134.34, 132.17, 131.77, 131.38, 129.87, 129.04, 128.41, 127.88, 126.84, 125.65, 125.07, 124.88, 124.88, 123.67. HRMS (EI), m/z (% relative intensity): 83.9667 (100), 149.0583 (3), 207.0481 (3), 284.0637 (4), 316.0423 (7), 345.0280 [(30), M⁺]. UV-Visible λ_{max} (MeOH): 369.0 (3.11); 484.5 (4.04); 743.5 (3.77). (Found: C, 69.61; H, 3.19; N, 4.01; S, 18.59%. Molecular formula C₂₀H₁₁NOS₂ requires C, 69.54; H, 3.21; N, 4.05; S, 18.56.)

6-(Thiophen-2-yl)-5H-benzo[a]phenoxazin-5-one (18)

(Table 1, entry 3). Method 2 was used to prepare the

title product from the cross-coupling of tributyl 2-thienyl stannane with 6-chloro-5H-benzo[a]phenoxazin-5-one in 6 h. Purification by flash chromatography applying 10% EtOAc/90% pet. ether as eluent provided the analytically pure dark brown solid product, yield 240 mg (73%), mp 203–204°C. NMR: δ_H (400 MHz, CDCl₃): 8.57–8.65 (1H, m); 8.33–8.31 (1H, m); 8.22–8.20 (1H, dd, J = 8.21, 8.21); 7.79–7.77 (1H, dd, J = 7.74, 7.74); 7.72–7.68 (2H, m); 7.52–7.50 (1H, dd, J = 7.51–7.47); 7.47–7.39 (2H, m); 7.34–7.30 (1H, m); 7.19–7.16 (1H, m). δ_C (150 MHz, CDCl₃): 181.91 (C¹⁴O), 146.85, 145.05, 143.85, 132.89, 132.09, 131.81, 131.78, 131.67, 131.35, 130.07, 129.60, 128.63, 126.62, 126.22, 125.55, 124.43, 115.85, 112.73. UV-Visible λ_{max} (MeOH): 364.5 (4.08); 493.0 (3.64); 750.0 (4.02). HRMS (EI), m/z (% relative intensity): 83.9533 (100), 142.5381 (8), 174.0802 (3), 240.0802 (3), 272.0522 (10), 301.0556 (12), 329.0512 [(93), M⁺]. (Found: C, 72.98; H, 3.40; N, 4.31%. Molecular formula C₂₀H₁₁NO₂S requires C, 72.93; H, 3.37; N, 4.25; S, 9.73.)

6-(Thiophen-2-yl)-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one (19) (Table 1, entry 4). Method 2 was used to cross-couple tributyl 2-thienyl stannane with 6-chloro-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one to afford the title product within 6 h. Purification by flash chromatography (45% EtOAc/55% pet. ether eluent) gave the analytically pure dark brown solid product, yield 257 mg (78%), mp >210°C (dec). NMR: δ_H (400 MHz, CDCl₃): 8.76–8.74 (1H, m); 8.55–8.53 (1H, dd, J = 8.54, 8.54); 8.26–8.24 (1H, m); 8.14–8.13 (1H, dd, J = 8.14); 7.72–7.67 (2H, m); 7.51–7.49 (1H, dd, J = 7.50, 7.50); 7.38–7.35 (1H, dd, J = 7.37, 7.30); 7.13–7.11 (1H, dd, J = 7.12, 7.10). δ_C (600 MHz, CDCl₃): 181.95 (C¹⁴O), 151.08, 146.95, 144.74, 144.01, 140.63, 132.81, 132.60, 131.58, 131.21, 130.77, 130.27, 129.52, 126.76, 126.41, 125.73, 125.41, 124.12, 113.81. UV-Visible λ_{max} (MeOH): 370.0 (3.81); 506.0 (3.24); 745.0 (3.87). HRMS

5-one into the title product within 6 h. Purification by flash (EI), m/z (% relative intensity): 71.0840 (2), 83.9540

(100), 301.0420 (2), 330.0464 [(100), M⁺]. (Found: C, 69.11; H, 3.07; N, 8.51; S, 9.74%. Molecular formula C₁₉H₁₀N₂O₂S requires C, 69.08; H, 3.05; N, 8.48; S, 9.70%.)

2-(Furan-2-yl)-10H-phenothiazine (20) (Table 1, entry 5). Method 1 was used to convert tributyl furan-2-yl stannane and 2-chloro-10H-phenothiazine into the title product in 5 h. Analytically pure product obtained by flash chromatography (5% EtOAc/95% pet. ether eluent) as yellow solid, yield 204 mg (77%), mp 174–176°C. NMR: δ_{H} (400 MHz, acetone-d₆): 7.83 (1H, br, s); 7.43–7.43 (1H, dd, J = 7.43, 7.43); 7.01–6.98 (1H, dd, J = 7.00, 7.00); 6.87–6.78 (3H, m); 6.67–6.56 (3H, m); 6.37–6.35 (1H, dd, 6.36, 6.36). δ_{C} (150 MHz, acetone-d₆): 154.19, 143.66, 143.39, 143.13, 142.98, 131.18, 128.39, 127.20, 123.02, 118.40, 118.20, 117.71, 115.57, 112.64, 110.33, 106.02. UV-Visible λ_{max} (MeOH): 747.0 (4.10). (Found: C, 72.47; H, 4.22; N, 5.21; S, 12.06%. Molecular formula C₁₆H₁₁NOS requires C, 72.43; H, 4.18; N, 5.28; S, 12.08.)

6-(Furan-2-yl)-5H-benzo[a]phenoxazin-5-one (21) (Table 1, entry 6). Method 2 was used to convert tributyl furanyl stannane and 6-chloro-5H-benzo[a]phenoxazin-5-one into the title product in 6 h. Analytically pure product was provided by flash chromatography (10% EtOAc/90% pet. ether eluent) as a dark brown solid, yield 210 mg (67%), mp 140–142°C. NMR: δ_{H} (400 MHz, CDCl₃) 8.62–8.60 (1H, m); 8.27–8.24 (1H, m); 7.72–7.63 (3H, m); 7.59–7.58 (1H, dd, J = 7.58, 7.58); 7.41–7.37 (1H, m); 7.30–7.24 (3H, m); 6.55–6.54 (1H, dd, J = 6.55). δ_{C} (150 MHz, CDCl₃): 181.02 (C¹⁴O), 146.91, 146.11, 145.53, 144.06, 142.61, 132.96, 131.99, 131.78, 131.32, 130.73, 129.54, 126.42, 125.34, 124.45, 116.13, 114.89, 111.40, 109.49. UV-Visible λ_{max} (MeOH): 447 (4.02). (Found: C, 72.62; H, 4.22; N, 5.19%. Molecular formula C₁₆H₁₁NO₂ requires C, 72.43; H, 4.18; N, 5.23.)

6-(Furan-2-yl)-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one (22) (Table 1, entry 7). Method 2 was used to convert tributyl furanyl stannane and 6-chloro-5H-naphtho[2,1-b]pyrido[2,3-e][1,4]oxazin-5-one to the title product within 6 h. Analytically pure product obtained by flash chromatography employing 50% EtOAc/50% pet. ether eluent as a dark brown solid, yield 220 mg (70%), mp 210–212°C. NMR: δ_{H} (400 MHz, CDCl₃): 8.84–8.82 (1H, m); 8.57–8.56 (1H, dd, J = 8.56, 8.56); 8.31–8.29 (1H, m); 7.77–7.69 (3H, m); 7.62–7.61 (1H, dd, J = 7.61, 7.61); 7.40–7.34 (2H, m); 6.59–6.58 (1H, dd, J = 6.58, 6.58). δ_{C} (150 MHz, CDCl₃): 180.98 (C¹⁴O), 151.89, 145.71, 145.66, 144.10, 143.26, 141.06, 133.07, 132.66, 131.88, 130.17, 126.62, 125.77, 125.70, 125.20, 116.44, 111.86, 110.72. UV-Visible λ_{max} (MeOH): 321.0 (4.05); 459.5 (3.87). (Found: C, 72.83; H, 3.17; N, 8.78%. Molecular formula C₁₉H₁₀N₂O₃ requires C, 72.61; H, 3.21; N, 8.91.)

Reduction of compounds 17–19, 21, and 22. In a typical experiment, compound 17 (345 mg, 1 mmol) was placed in a reaction flask containing water (2 mL) and acetone

(40 mL). Sodium dithionite (0.5 g) was added, and the mixture was refluxed in a water bath for 1.5 h. During the refluxing period, the color changed from red to yellow. The entire mixture was poured into a solution containing 0.5 g of dithionite in 100 mL of ice-cold water and stirred. This was quickly filtered by suction, but before the product could be collected from the filter paper, it had turned reddish. Analysis of the product confirmed it to be the starting iminoquinoid compound 17. This shows the reduced compound was auto-oxidized under this condition. Similar observations were seen in the case of compounds 18, 19, 21, and 22.

Acknowledgments. We thank the Petroleum Technology Development Funds (PTDF) for financial support and Cardiff University for a short-term research opportunity.
